A uniquely personal yet deeply informed exploration of the hidden history of class in American life. From the decks of the Mayflower straight through to Donald Trump's "American carnage," class has always played a role in American life. In this remarkable work, Steve Fraser twines our nation's past with his own family's history, deftly illustrating how class matters precisely because Americans work so hard to pretend it doesn't. He examines six signposts of American history--the settlements at Plymouth and Jamestown; the ratification of the Constitution; the Statue of Liberty; the cowboy; the "kitchen debate" between Richard Nixon and Nikita Khrushchev; and Martin Luther King's "I Have a Dream" speech--to explore just how pervasively class has shaped our national conversation. With a historian's intellectual command and a riveting

narrative voice, Fraser interweaves these examples with his own past--including his false arrest on charges of planning to blow up the Liberty Bell during the Civil Rights era--to tell a story both urgent and timeless.

This book is a definitive reference source for the growing, increasingly more important, and interdisciplinary field of computational cognitive modeling, that is, computational psychology. It combines breadth of coverage with definitive statements by leading scientists in this field. Research in computational cognitive modeling explores the essence of cognition and various cognitive functionalities through developing detailed, process-based understanding by specifying computational mechanisms, structures, and processes. Given the complexity of the human mind and its manifestation in behavioral flexibility, process-based computational models may be necessary to explicate and elucidate the intricate details of the mind. The key to understanding cognitive processes is often in fine details. Computational models provide algorithmic specificity: detailed, exactly

specified, and carefully thought-out steps, arranged in precise yet flexible sequences. These models provide both conceptual clarity and precision at the same time. This book substantiates this approach through overviews and many examples.

Typical texts develop students' knowledge while only minimally developing the general skills they will need for success in school and in life. The goal of our text is to assist students in acquiring the most important skills for facing the diverse challenges life presents. The book contains an overview of theories of intelligence, but itself is based in large part on a theory according to which individuals need creative skills to generate new ideas and a vision for the future, analytical skills to make sure that the vision is a good one, and practical skills to execute the ideas and to persuade other people of their value. The book considers key skills in problem solving, logical reasoning, analysis of arguments, knowledge acquisition, creative and practical thinking, automatizing information processing, and avoiding life traps that derail even the most intelligent among us.

Class-tested and coherent, this textbook teaches classical and web information retrieval, including web search and the related areas of text

classification and text clustering from basic concepts. It gives an up-to-date treatment of all aspects of the design and implementation of systems for gathering, indexing, and searching documents; methods for evaluating systems; and an introduction to the use of machine learning methods on text collections. All the important ideas are explained using examples and figures, making it perfect for introductory courses in information retrieval for advanced undergraduates and graduate students in computer science. Based on feedback from extensive classroom experience, the book has been carefully structured in order to make teaching more natural and effective. Slides and additional exercises (with solutions for lecturers) are also available through the book's supporting website to help course instructors prepare their lectures.
