During this course, the student will learn the different aspects of power systems: from the development of electrical energy systems (long term planning) up to real time

operation. The first part of the course focuses on the modeling and simulation of modern power systems. This includes the dynamic modeling of power components and their controls. Design and Management of Electric Power Systems - KU Leuven An electric power system is a network of electrical components deployed to supply, transfer, and use electric power. An example of a power system is the electrical grid that provides power to homes and industry within an extended area. The electrical grid can be broadly divided into the generators that supply the power, the transmission system that carries the power from the generating centres to the load centres, and the distribution system that feeds the power to nearby homes and industries. Electric power system - Wikipedia The standalone PV system is an excellent way to utilize the readily available eco-friendly energy of the sun.
