 Material and energy balances are very important in chemical engineering and industry. Material balances are fundamental in the control of processing, largely in the control of yields of the products. The first material balances are determined and improved during pilot plant experiments. When any changes occur in the process, the material balances need to be determined again.

 Since this work is done on the system, it enters the energy balance as a positive quantity. Therefore the total energy flow into the system due to mass flow is as follows:  $\dot{E} = (\dot{E} + \dot{E} + \dot{E}) + \dot{Q}$

 This zyBook provides a new, highly-interactive introduction to Material and Energy Balances, which is a first course in the exciting and growing field of Chemical Engineering. It is a complete replacement for existing textbooks on the topic and includes hundreds of interactive items proven to help students learn and stay engaged, and for which instructors often assign some homework points.  
 Material and Energy Balances - zyBooks  
 Material and energy (M&E) balances are fundamental to chemical (process) engineering, environmental engineering and industrial chemistry. This text presents M&E balance calculations in a compact, transparent format accessible to students and professionals in the above fields, and to others who want to quantify the physical progress of our civilization.  
 Material and energy balances for engineers and ...  
 The concept of energy conservation as expressed by an energy balance equation is central to chemical engineering calculations. Similar to mass balances studied previously, a balance on energy is crucial to solving many problems.  
 Chapter 7 - Energy and Energy Balances  
 Since the absorber column involves 3 species (i.e. acetone, air, and water), we can have up to 2 “independent” species balances  
 Hence, the total # of equations = 3 (1 overall-balance equation and 2 species-balance equation) while the # of unknowns = 3  
 Accordingly, the degree of freedom (DoF), which is defined as follows:  $DoF = (\# \text{ of unknowns}) - (\# \text{ of equation available})$   
 for doing the material balances around the absorber column is  $DoF = (3) - (3) = 0$   
 When  $DoF = 0$ , we can solve for ...

 A mass balance, also called a material balance, is an application of conservation of mass to the analysis of physical systems. By accounting for material entering and leaving a system, mass flows can be identified which might have been unknown, or difficult to measure without this technique. The exact conservation law used in the analysis of the system depends on the context of the problem, but all revolve around mass conservation, i.e., that matter cannot disappear or be created ...
