ADAPTIVE FILTERS - WordPress.com Applications of Adaptive Filtering 5 In practical applications the measurement noise is unavoidable, and if it is uncorrelated with the input signal, the expected value of the adaptive-filter coefficients will coincide with the unknown-system impulse response samples. The output error will of course be the measurement noise (Diniz, 2008). Applications of Adaptive Filtering - IntechOpen One common adaptive filter application is to use adaptive filters to identify an unknown system, such as the response of an unknown communications channel or the frequency response of an

auditorium, to pick fairly divergent applications. Other applications include echo cancellation and channel identification. Overview of Adaptive Filters and Applications - MATLAB ... An adaptive filter is a system with a linear filter that has a transfer function controlled by variable parameters and a means to adjust those parameters according to an optimization algorithm. Because of the complexity of the optimization algorithms, almost all adaptive filters are digital filters. Adaptive filters are required for some applications because some parameters of the desired processing operation are not known in advance or are changing.
