**Advances in Wireless Sensors and

According to the Ito report announced by
the Ministry of Economy, Trade and
Industry in August 2014, it was pointed out
that the issues of Japanese companies are

not in asset turnover rates and financial
leverage, but in terms of their ability to
make earnings, compared to western
companies. However, I believe that both
accounts receivable turnover and
inventory turnover are generally lower
than those in Europe and the United
States, among asset turnover rates, which
is an issue for CCC (Cash Conversion
Cycle) management. Inventory is an

important management resource. Inventory is said to be a source of profit for business, at the same time, to cause loss. Especially in manufacturing, retail and wholesale business, management indicators are used to measure whether product inventory is being converted into sales efficiently. In general, the following two are used. 1. Inventory turnover rate $\text{Inventory turnover (times)} = \frac{\text{sales} \cdot \text{cost of sales (annual)}}{\text{inventory amount}}$ The inventory turnover rate is mainly used by executives for presentations for investors or shareholders. 2. Inventory turnover period $\text{Inventory turnover period} = \frac{\text{inventory amount}}{\text{sales or cost of sales (monthly or daily)}}$ In fast-rotating industries such as foods, the daily sales are used for denominator and "days of stock days" is indicated. The inventory rotation period is practically used well. Annual average and month end stock are used for inventory, but the actual value for sales period / cost of sales is used for that period. It is enough to explain the past and current situation of inventory, but I think that it is inappropriate as an indicator for future decision-making internally. In other words, it is not inventory turnover as

management accounting. I am convinced that inventory turnover days are an indicator that can assist decision-making to be shared by management, sales department in charge of operations, manufacturing, procurement, and logistics personnel as inventory-based management consultant. Each era brings with it new techniques and methods of waging a war. While military scholars and experts have mastered land, sea, air and space warfare, time has come that they studied the art of cyberwar too.

Our neighbours have acquired the capabilities to undertake this new form of asymmetric form of warfare. India too therefore needs to acquire the capabilities to counter their threat. Cyber space seems to have invaded every aspect of our life.

More and more systems whether public or private are getting automated and networked. This high dependence of our critical infrastructure on Information and Communication Technology exposes it to the vulnerabilities of cyberspace. Enemy now can target such infrastructure through the cyberspace and degrade/ destroy them. This implies that the critical information infrastructure of the country and military networks today are both

equally vulnerable to enemy's cyberattacks. India therefore must protect its critical information infrastructure as she would protect the military infrastructure in the battlefield. Public - Private Partnership model is the only model which would succeed in doing so. While the Government needs to lay down the policies and frame the right laws, private sector needs to invest into cyber security. Organisations at national level and at the level of armed forces need to be raised which can protect our assets and are also capable of undertaking offensive cyber operations. This book is an attempt to understand various nuances of cyber warfare and how it affects our national security. Based on the cyber threat environment, the books recommends a framework of cyber doctrine and cyber strategies as well as organisational structure of various organisations which a nation needs to invest in.

Reverse Logistics at Command Naval Surfaces Forces Real-time & Reutilization Asset Management (R-RAM) San Diego Warehouse Springer Nature

The purpose of this MBA project is to

evaluate and assess the inventory management database at the Commander, Naval Surface Forces (CNSF) Real-time Reutilization Asset Management (R-RAM) San Diego warehouse. CNSF spends approximately \$4 million annually for contractor support to operate the R-RAM warehouses for the Atlantic and Pacific Surface Fleets, and in return receives cost-avoidance for spares issued from the warehouses. The warehouses contain A-condition spare parts that were offloaded from decommissioned ships, as well as excess inventory from afloat units. Spare parts in the R-RAM warehouses were procured either by using initial outfitting allowance or by Operations and Maintenance (O & M) funds. The spare part is issued free to the requesting ship. The R-RAM inventory is visible to customers through the Global Distance Support Center and various databases. The goals of this study of the R-RAM inventory management database are to determine ways to increase throughput while simultaneously reducing inventory and operating expense, reduce inventory footprint by identifying "dead" stock and obsolete spares, recommend a stocking

policy, and develop recommendations for current and future operations.

 This book discusses inventory models for determining optimal ordering policies using various optimization techniques, genetic algorithms, and data mining concepts. It also provides sensitivity analyses for the models' robustness. It presents a collection of mathematical

models that deal with real industry scenarios. All mathematical model solutions are provided with the help of various optimization techniques to determine optimal ordering policy. The book offers a range of perspectives on the implementation of optimization techniques, inflation, trade credit financing, fuzzy systems, human error, learning in production, inspection, green supply chains, closed supply chains, reworks, game theory approaches, genetic algorithms, and data mining, as well as research on big data applications for inventory management and control. Starting from deterministic inventory models, the book moves towards advanced inventory models. The content is divided into eight major sections: inventory control and management - inventory models with trade credit financing for imperfect quality items; environmental impact on ordering policies; impact of learning on the supply chain models; EOQ models considering warehousing; optimal ordering policies with data mining and PSO techniques; supply chain models in fuzzy environments; optimal production models

for multi-items and multi-retailers; and a marketing model to understand buying behaviour. Given its scope, the book offers a valuable resource for practitioners, instructors, students and researchers alike. It also offers essential insights to help retailers/managers improve business functions and make more accurate and realistic decisions.

In recent times wireless sensors and sensor networks have become a great interest to research, scientific and technological community. Though the sensor networks have been in place for more than a few decades now, the wireless domain has opened up a whole new application spaces of sensors. Wireless sensors and sensor networks are different from traditional wireless networks as well computer networks and therefore pose more challenges to solve such as limited energy, restricted life time, etc. This book intends to illustrate and to collect recent advances in wireless sensors and sensor networks, not as an encyclopedia but as clever support for scientists, students and researchers in

order to stimulate exchange and discussions for further developments.

Inventory is one of the largest investments that a company may have, and so is worthy of continual examination to maximize the return from this asset. It is of critical importance to ensure that funds are only used for the exact inventory items needed to further an organization's goals. All other inventory is a liability, since it soaks up excess cash and is in danger of becoming obsolete. In *Inventory Management*, we explore a broad range of alternatives that can be used to precisely target the use of inventory, while minimizing the inventory investment. The topics covered include inventory strategy, materials forecasting, production processes, warehouse management, product design, the supply chain, and more - essentially all areas of a business that touch upon the inventory asset.

Asset Tracking and Inventory Management System for PTMK Lulu Press, Inc

An efficient and accurate inventory of a state highway agency's assets, along with the means to assess the condition of those assets and model their performance, is critical to enabling an agency to make informed investment decisions in a Transportation Asset Management (TAM) environment. Today, new technologies provide fast and improved ways to gather, process, and analyze data. The key is to identify and gather the most useful, reliable, cost-effective information and use it to make informed decisions for asset management. Four key infrastructure areas have been identified as primary asset components; pavements, bridges, geotechnical features, and roadside appurtenances. Each area contains multiple categories and data elements important for sound decision making. Although some similarities exist in these four primary categories, the nature of data collection may differ, depending on the asset type. The sheer number of data elements and the length of asset networks for pavements and roadside

appurtenances render the automated highway speed data collection method a necessity rather than a luxury. However, the discrete nature of bridges and geotechnical features make the automated mobile data collection method on a network level unfeasible with today's technology. Important issues in the collection process include precision, subjectivity and variability of the process itself, as well as speed, safety of the survey crew, proximity of the public, cost, etc. Although previous research has attempted to address these issues and determine the most appropriate method(s), the question remains as to which roadway data collection system is best for state highway agencies given real world constraints. This research set up a "sealed envelope" experiment wherein the identification, location, description, and quality of the asset data elements are known only to NCSU researchers. Vendors are informed of only the data necessary to perform their evaluation. To support this effort at 95-mile test course near Raleigh, North Carolina was identified, which contained a sampling of pavement, roadside, geotechnical and bridge

elements. This document reports on the findings from the study.
