The Wiley International Handbook of Correctional Psychology Jossey-Bass
Helping the Suicidal Person provides a highly practical toolbox for mental health professionals. The book first covers the need for professionals to examine their own personal experiences and fears around suicide, moves into essential areas of risk assessment, safety planning, and

treatment planning, and then provides a rich assortment of tips for reducing the person's suicidal danger and rebuilding the wish to live. The techniques described in the book can be interspersed into any type of therapy, no matter what the professional's theoretical orientation is and no matter whether it's the client's first, tenth, or one-hundredth session. Clinicians don't need to read this book in any particular order, or even read all of it. Open the book to any page, and find a useful tip or technique that can be applied immediately.

Bipolar disorder is a chronic and debilitating mental illness affecting a significant proportion of the world's population. It is associated with significant impairments in health-related quality of life and psychosocial functioning, and has significant illness-related morbidity and heightened mortality rates due to medical comorbidities and suicide. The management of this disorder requires a complex combination of pharmacological and psychosocial interventions which can be challenging for clinicians. Written by world experts in the field of bipolar disorder, The Treatment of Bipolar Disorder: Integrative Clinical Strategies

and Future Directions provides readers with a concise and comprehensive guide to the integrative management of bipolar disorder. This resource contains 31 chapters on the various management choices available, from both established and novel treatment areas, such as psychoeducation, psychotherapeutic interventions, neuromodulatory approaches and novel therapeutic targets. The complexity and diversity of the management choices available makes this a continually evolving field and necessitates forward thinking. By both discussing the current management of bipolar disorder, and the future developments available, this resource provides all clinicians working with patients with bipolar disorder an up-to-date and reflective guide to its management and what the future holds. Suicide risk assessment is a core competency that mental health professionals are expected to acquire during their training, yet the reality of potential suicides can prove daunting for busy practitioners faced with an overload

of information on the subject. This book meets that challenge head-on by providing clinically useful information for anyone encountering patients at risk for suicide. The American Psychiatric Publishing Textbook of Suicide Assessment and Management calls on the authority of 40 expert contributors including members of the APA's Workgroup on Suicidal Behaviors, who developed the APA Practice Guideline for the Assessment and Treatment of Patients With Suicidal Behaviors reflecting a wide range of clinical and forensic experience. The authors provide informative cases accompanied by analysis that integrates clinical findings with textual discussion, along with chapter-end "key points," in order to help practitioners ? understand demographic, gender, and cultural variables in suicide risk? use psychological tests and scales in assessment? assess risk in special populations, such as children and adolescents and the elderly, and jail and prison inmates? determine treatment options: psychopharmacological/ECT, psychodynamic, and collaborative (or "split") treatment ? manage suicide risk in the context of major mental disorders

(depression, bipolar disorder, schizophrenia, anxiety, personality disorders, and substance-related disorders), with specific guidelines for risk assessment? address suicide risk in outpatient, emergency, and inpatient and partial hospitalization settings, patient safety versus freedom of movement, and strategies for increasing the safety factor in various aspects of practice In addition to addressing the many facets of patient care including cautioning against a suicide risk factor created by limitations of benefits in managed-care situation the book also discusses clinician care: how practitioners can cope with the anxiety and fatigue arising from treating suicidal patients, the professional's role following a patient's suicide, legal issues involving standard of care and liability, and risk management guidelines for avoiding malpractice litigation. Suicide risk exists along an ever-changing continuum. This book underscores that risk assessment is a process, not an event. It clearly shows how sound assessment can lead to more effective management of patients at high risk for suicide.

This volume is a guide for the hospital workforce related to suicide prevention. Written by experts in the field, this text is the only one that also includes the revised DSM-5 guidelines. It is also the first to

cover both prevention in one concise guide, offering a well-rounded approach to long- and short-term prevention. The book begins by establishing the neurobiology of suicide before discussing the populations at risk for suicide and the various environments where they may present. The book addresses the epidemiology, including groups at heightened risk; etiology, including several types of risk factors; prevention, including large-scale community-based activities; and postvention, including the few evidence-based approaches that are currently available. Unlike any other text on the market, this book does not simply focus on one particular demographic; rather, the book covers a wide range of populations and concerns, including suicide in youths, racial minorities, patients suffering from serious mental and physical illnesses, psychopharmacological treatment in special populations, and a wide array of challenging scenarios that are often not addressed in the very few up-to-date resources available. Suicide Prevention is an outstanding resource for psychiatrists, psychologists, hospitalists, primary care doctors, nurses, social workers, and all

medical professionals who may interface with suicidal patients.

Patient suicide is an unavoidable occupational hazard of psychiatric practice. Indeed, it is the rare clinician who does not struggle, even agonize, over the complex task of assessing and managing the risk of suicide in patients. Patient suicides account for the greatest number of malpractice suits filed against psychiatrists and for the greatest number of settlements and verdicts covered by professional liability insurers. In this book, written by a clinician for clinicians, Dr. Simon, an established expert in psychiatry and law, offers A solid, easy-to-understand review of how medical malpractice law applies to patient suicides. He discusses the standards of care physicians must meet, the conditions associated with malpractice liability, and how best to minimize risks of litigation. Extensive references to peer-reviewed literature on suicide and recent malpractice cases, including those triggered by patient suicides, which give insight into the latest developments in both the scientific

community and the courts. Much-needed practical advice, including advice on working with suicide risk assessments and suicide prevention contracts, on treating suicidal patients in various settings (outpatient, inpatient, collaborative, and emergency), and on coping with issues arising in the aftermath of a patient's suicide (documentation, confidentiality, and survivor care). Clearly defined risk management guidelines that will help clinicians avoid litigation or establish a sound legal defense if sued for malpractice. Numerous case examples that make the theoretical discussions and clinically based risk management guidelines that follow come alive. Rich in advice that draws on the author's more than 40 years of clinical experience, this book serves as an essential aid to clinicians.

Suicide creates great suffering for the survivors - the family members, friends, community, and caregivers who were involved with the victim. Preventing suicide is understandably the top priority

for clinicians who work with very disturbed mentally ill clients.

Suicide Assessment and Treatment
Springer
Since the first edition of *Clinical Manual for Assessment and Treatment of Suicidal Patients* was published in 2005, advances have been made that increase our understanding of suicidal and self-destructive behavior. Although clinicians cannot unerringly predict which patients will die by suicide, they can focus more successfully on early identification of suicidal behavior and effective intervention, and this new edition of the clinical manual thoroughly explores not only assessment of suicidality but what comes after an at-risk patient has been identified. The authors argue that treating specific psychiatric disorders is not enough to prevent suicide, and they offer clinicians the necessary information and strategies to bridge that gap. The authors' main premise is that suicide is a dangerous and short-term problem-solving

behavior designed to regulate or eliminate intense emotional pain -- a quick fix where a long-term effective solution is needed -- and this understanding is the underpinning of the assessment and treatment strategies the authors recommend. The content of this new edition has been thoroughly reviewed and revised, and substantive changes have been made to specific chapters to ensure that the book represents the most current thinking and research, while retaining the strengths of the previous edition. The chapter on assessment has been revised to put the fundamental components of effective treatment in a clinical, case-oriented context and includes an easy-to-use assessment protocol that allows clinicians to determine where individual patients stand on seven dimensions (cognitive rigidity, problem-solving deficits, heightened mental pain, emotionally avoidant coping style, interpersonal deficits, self-control deficits, and environmental stress and social support deficits). The many issues involved in the use of psychotropic medications in suicidal patients are addressed in a new chapter, which includes information on the relevant

classes of drugs (such as antidepressants and anti-anxiety agents) and the issues that may arise with their use, including side effects, degree of lethality, and tendency to aggravate suicidality on introduction and withdrawal of the medication. The chapter on special populations has been expanded to include adolescents, elders, and patients with co-occurring substance abuse or psychosis. Because of additional vulnerabilities, treating these groups may call for the use of added or special techniques to ensure the best therapeutic outcomes. Primary care physicians are the first point of contact for many patients, and they may require additional preparation in order to assess and respond to those experiencing suicidal thoughts. The chapter "Suicidal Patients in Primary Care" explores strategies for screening, recognizing, and assessing risk; treating the initial crisis; and developing a crisis management plan. "Tips for Success" appear at intervals, and "The Essentials" are included at the end of each chapter, highlighting the most important concepts. In addition, there are scores of helpful charts and exercises. Practical, accessible, and reader-friendly,

the Clinical Manual for Assessment and Treatment of Suicidal Patients is not an academic book but rather is one designed to become an indispensable part of clinicians' working libraries.

 "The main document provides detailed information on conducting suicide risk assessments and includes specifics on the roles and responsibilities of generalist and mental health services. It sets out the comprehensive principles and practices for suicide risk assessment and management. These protocols refer to situations where a person has presented to a community health service, where mental health professionals are assessing someone at risk of suicide in the community or where a person has presented to an emergency department and the mental health service is contacted for assessment. All mental health professionals are required to conduct thorough clinical assessments and manage people regarded as being at risk of suicide." -- Website summary.

[The Suicidal Crisis](#) Routledge
 This book explores suicide prevention

perspectives from around the world, considering both professionals' points of view as well as first-person accounts from suicidal individuals. Scholars around the globe have puzzled over what makes a person suicidal and what is in the minds of those individuals who die by suicide. Most often the focus is not on the motives for suicide, nor on the phenomenology of this act, but on what is found from small cohorts of suicidal individuals. This book offers a tentative synthesis of a complex phenomenon, and sheds some light on models of suicide that are less frequently encountered in the literature. Written by international experts, it makes a valuable contribution to the field of suicidology that appeals to a wide readership, from mental health professionals to researchers in suicidology and students.
