This text offers descriptions and analyses of some of the different ways in which schools and other educational institutions have started to establish new collaborative relationships in today's competitive educational marketplace. Using case studies, the book describes examples of such collaborative structures.; Educational consortia have been established as a vehicle for professional and curriculum development, as a source of mutual support and as a condition of mutual survival. As the "LEA monopolies" have been forced to shed many of their traditional functions or schools have opted out, schools have found it necessary to re-create parts of their collaborative structures out of sheer self- Interest.; For Some Educators Who Continue To Be Attached To Notions Of "an educational service" and professional collegiality in the provision of such a service, inter-institutional collaboration becomes seen as something to be valued independently of the instrumental benefits which it provides. For this variety of reasons, consortium working and collaborative structures seem set to develop in spite of, or as a necessary antidote to, educational markets. Understanding the role and operation of such structures is a necessity for educational managers in all parts of the educational service.

What do I need to know about science to teach children in primary school? How can I make my science teaching successful? How do children learn to investigate scientifically? What are the dos and don'ts of science teaching? Written to support teachers who need to boost their science knowledge, this book covers science knowledge in sufficient breadth and depth to enable you to teach science effectively up to the end of Key Stage 2, as well as the core teaching and learning issues involved in the investigative process. Whether you are a student or a fully qualified teacher, the book is designed to help you find what you need quickly. The introduction provides a guide to how to use the book, including a table which cross references the subject knowledge against the National Curriculum, the QCA Scheme of Work and Primary Science Topics. This enables you to use the book in different ways, depending on your individual requirements. To ensure that teachers will be able to teach and respond to questions appropriately, the authors take science knowledge beyond what is required for Key Stage 2. This is important, as it helps to avoid over-simplifying concepts which can then cause misconceptions at Key Stage 3 and beyond. It also helps to broaden and develop the primary teacher's own

knowledge. Science for Primary School Teachers is a core text for teachers in training, and in professional development into the induction year and beyond.

Chemistry is a conceptual subject and, in order to explain many of the concepts, teachers use models to describe the microscopic world and relate it to the macroscopic properties of matter. This can lead to problems, as a student's every-day experiences of the world and use of language can contradict the ideas put forward in chemical science. These titles have been designed to help tackle this issue of misconceptions. Part 1 deals with the theory, by including information on some of the key alternative conceptions that have been uncovered by research; ideas about a variety of teaching approaches that may prevent students acquiring some common alternative conceptions; and general ideas for assisting students with the development of appropriate scientific conceptions. Part 2 provides strategies for dealing with some of the misconceptions that students have, by including ready to use classroom resources including copies of probes that can be used to identify ideas held by students; some specific exercises aimed at challenging some of the alternative ideas; and classroom activities that will help students to construct the chemical concepts required by the curriculum. Used together, these two books will provide a good theoretical underpinning of the fundamentals of chemistry. Trialled in schools throughout the UK, they are suitable for teaching ages 11-18.

It offers an accessible guide to all the main concepts of Key Stages one and two science teaching. Illustrating the importance of issues such as resourcing and assessing science in the primary classroom, the book offers guidance for practicing teachers who consider themselves "non-specialists" in science.
