 This comprehensive volume provides teachers, researchers and education professionals with cutting edge knowledge developed in the last decades by the educational, behavioural and neurosciences, integrating cognitive, developmental and socioeconomic approaches to deal with the problems children face in learning mathematics. The neurocognitive mechanisms and the cognitive processes underlying acquisition of arithmetic abilities and their significance for education have been the subject of intense research in the last few decades, but the most part of this research has been conducted in non-applied settings and there's still a deep discrepancy between the level of scientific knowledge and its implementation into actual educational settings.

Now it's time to bring the results from the laboratory to the classroom. Apart from bringing the theoretical discussions to educational settings, the volume presents a wide range of methods for early detection of children with risks in mathematics learning and strategies to develop effective interventions based on innovative cognitive test instruments. It also provides insights to translate research knowledge into public policies in order to address socioeconomic issues. And it does so from an international perspective, dedicating a whole section to the cultural diversity of mathematics learning difficulties in different parts of the world. All of this makes the International Handbook of Mathematical Learning Difficulties an essential tool for those involved in the daily struggle to prepare the future generations to succeed in the global knowledge society.

The Unofficial Minecraft Math Workbook 2-Digit and 3-Digit Addition and Subtraction Ages 7+ Math Step-By-step

Chapter 1 is a brief history of gender and mathematics education research. Three main perspectives are addressed: biological, socialization, and feminist. The intent of this article is to (a) provide an overview of research on the existence of gender differences in mathematics, (b) interpret the existence of gender differences in mathematics through the biological (genetic predisposition) and socialization (environmental factors) perspectives, and (c) describe the feminist perspective through three mathematics and gender viewpoints (Mathematics is independent of gender, Mathematics as a gendered construct, and Mathematics through multiple

identities) that focus on women's way of knowing mathematics. These perspectives recommend near and far term changes for teaching and research practices as they relate to gender in mathematics education research. In Chapter 2, the strategies elementary school children use to solve multi-digit addition and subtraction story problems that require regrouping are investigated in two studies. Study 1 replicates the Fennema and colleagues (1998) study by re-examining existing Hiebert and Wearne (1992, 1996) data on 72 children's addition and subtraction solution strategies. Study 2 is an extension study with new data from individual interviews on 70 third-grade children's multi-digit addition and subtraction problem solving strategies that require regrouping. It extends the Fennema and colleagues (1998) study by identifying children's strategy preferences and the reasons they provide for those preferences. Gender differences in strategy use were not as strong as those reported by Fennema and colleagues (1998). Boys and girls reasons for preferring to use certain strategies reveal different understandings for what it means to learn mathematics. Results support the idea that early gender differences in strategy use may influence later gender differences in problem solving performance that appear in middle school and continue throughout high school.
