Machinability of Advanced Materials
addresses the level of difficulty involved in
machining a material, or multiple
materials, with the appropriate tooling and
cutting parameters. A variety of factors
determine a material's
machinability, including tool life rate,
cutting forces and power
consumption, surface integrity, limiting

rate of metal removal, and chip
shape. These topics, among others, and
multiple examples comprise this research
resource for engineering students,
academics, and practitioners.

I am Special is a workbook developed by
Peter Vermeulen and already used
extensively with young people with autism
spectrum disorder. The workbook is
designed for a child to work through with
an adult - parent, teacher or other
professional. Unlike other books, its
content and layout are devised especially

for children who read, think and process
information differently. I am Special is
divided into two parts. The first is a
theoretical introduction that explains how
to inform children that they have autism or
Asperger Syndrome and how to use the
worksheets with groups or individuals. The
second part consists of a series of
worksheets which the child works through
with an adult to create a unique and
personal book about him or herself. It
includes a series of exercises that present
autism positively. They strike a balance
between general facts, information about
autism and personal information, covering

the strengths an autistic person may have as well as the difficulties they may face. I am Special can be used with young people over the age of ten years. Not only is it an excellent source of information for the autistic child; it can be the first step in a process of counselling or psychotherapy or the springboard for a discussion group on autism.

The future of manufacturing companies depends largely on their ability to adapt to swiftly changing global conditions. These are exemplified by international competition, rapidly growing intercommunication and the increased significance of environmental issues [KLOC98a, ENGE02]. Precision machining with geometrically undefined cutting edges represents a key production engineering technology with high efficiency, security and machining

quality. DIN norm 8589 subsumes within the group “machining with geometrically - defined cutting edges” the following material removal manufacturing processes: grinding, honing, lapping, free abrasive grinding and abrasive blast cutting. - chining is carried out in these production methods by means of more or less - regularly formed grains composed of hard substances brought into contact with the material. Of all methods understood as machining with geometrically undefined cutting edges, only grinding, honing and lapping can, strictly speaking, be considered p- cision machining. Free abrasive grinding and abrasive blast cutting, also treated in this book, represent a special group, as they generally cannot bring about geom- rical change in the material.

A Practical Introduction to Stereochemistry

Stereoisomers are compounds with the same chemical formula and connectivity but with different arrangements of their atoms in 3-dimensional space.

Stereochemistry encompasses the study of stereoisomers and their properties. Despite having an identical chemical formula, stereoisomers can have drastically different biological, medicinal, and chemical properties. Basic Organic Stereochemistry explains in clear, concise terms the concepts and properties of stereoisomers. Ideal both as a text for advanced undergraduate or graduate students and as a handy guide for researchers in industry, this superb text covers: * Polarimetry and optical rotation * Internal coordinates, configuration, and conformation * Nature of stereoisomers * Barriers between stereoisomers and residual stereoisomers * Symmetry operators and symmetry point groups * Properties of stereoisomers and stereoisomer discrimination * Separation of stereoisomers, resolution, and racemization Suitable for students in organic and biological chemistry, Basic Organic Stereochemistry is unparalleled as a convenient text.

Mechanical Deburring and Surface Finishing Technology Springer Nature
 Heat treatment of metallic alloys constitutes an important step within the production process. The heat treatment process itself is considered as a cycle of heating the workpieces to a

predetermined temperature, keeping them at this temperature for the time period required, and cooling them to room temperature in an appropriate way. The process of heating and keeping workpieces at the required temperature is now adays weil mastered and mostly automatized. The process of cooling or quenching which determines actually the resulting properties, is handicapped with many physical and technical uncertainties. Good results can already be obtained predominantly by using empirically based practice. But increased demands on the properties of the pro ducts as well as demands on safety and environment conditions of the quenching media require efforts to investigate the details of the quenching process and to transfer the results of the research to practical application. Advances in the knowledge about quenching processes have been achieved by modem applied thermodynamics especially by the heat and mass transfer researches; further the application of computer technology was helpful to new approaches in quenching pro cesses. Special emphases has been given to: - The theory of heat transfer and

heat exchange intensification during quenching - Wetting kinematics - Residual stresses after quenching - Determination of the quenching intensity - Prediction of microstructural transformation and hardness distribution after quenching, the latter with some limitations.

In spite of the very great progress made in ceramic science, and the elegance and excitement of the research which has been performed, the real driving force for developments in ceramics remains their potential applications. The opportunity for dramatic scientific advances was certainly one reason for the "ceramic fever" of a decade ago, but there is also no doubt that the prediction of an annual market for fine ceramics, amounting to 6 billion Yen played a role.
