Electrostatic discharge, or ESD, is the rapid and spontaneous transfer of electrostatic charge that occurs between two bodies at different electrostatic potentials. ESD is frequently encountered in everyday life: walking across a carpet then touching a metal doorknob, for example. It's much more dangerous for electronics, however, and requires the use of grounding protection methods.Electrostatic Discharge (ESD) - Semiconductor EngineeringElectrostatic Discharge or ESD is a fact of everyday life and it is of particular importance in the electronics industry these days. Years ago when thermionic valves / vacuum tubes were used it was not a problem, and even with the introduction of transistors few considered it a problem. However when MOSFETs were introduced their failure rates rose, the problem was investigated and it was found that static build up was sufficient to cause the oxide layer in
