In 1988 we presented our Guide to Bone Marrow Transplantation. The reception has been enthusiastic and we have received a flood of critical comments, suggestions and requests to provide an update in due time. Although several books on marrow transplantation have recently been published, their scope and goal have generally been different. Hence, we have decided to prepare a second edition of the Guide. Our aim was to maintain a short, concise text which nevertheless would incorporate changes that have occurred over the past four or five years. We have streamlined the description of pretransplant considerations, by condensing two sections into one (Treatment Planning and Timing of Transplantation). This also facilitated the review of controversial indications for marrow transplantation, for example in patients with acute myelogenous leukemia in first chemotherapy-induced remission. We have updated the chapter dealing with conditioning regimens and have expanded the section on donor selection, in particular in regard to the current level of tissue typing and the identification of unrelated volunteer donors. In the chapter on collection, processing, and infusion of marrow, we have incorporated recent developments, for example, the use of closed systems for marrow harvesting and processing and the use of solid phase separation of stem cells.

Currently more than 100,000 patients undergo blood and marrow transplantation (BMT) annually worldwide, a number which is steadily increasing. Long-term survival after BMT has improved

significantly since its inception over 40 years ago, due to improved supportive care and early recognition of long-term complications. With broadening indications, more options for BMT, and improvement in survival, by 2020 there may be up to a million long-term survivors after BMT globally. Higher than average rates of second malignancies and cardiopulmonary, infectious, endocrine, and renal diseases, and bone loss or avascular necrosis amongst this population suggest that the rapidly swelling ranks of BMT survivors require more frequent screening and earlier interventions than the general population. The purpose of *Blood and Marrow Transplantation Long-Term Management* is to describe practical approaches to screening for and managing these late effects, with the goal of reducing preventable morbidity and mortality associated with BMT. This unique new book is the first to address the needs of the increasing population of long-term survivors after stem cell transplantation, making it a must-have resource for all oncologists, hematologists, and primary care physicians involved in the long-term management and care of BMT patients.
