To help learners prepare for future careers in health care, Career Connection Videos and Homeostatic Imbalance discussions have been updated, and end-of-chapter Clinical Case Studies have been extensively reworked to include new NCLEX-Style questions. Mastering A&P is not included. Students, if Mastering A&P is a

recommended/mandatory component of the course, please ask your instructor for the correct ISBN. Mastering A&P should only be purchased when required by an instructor. This book is a concise but comprehensive text for review and self evaluation in the study of the microscopic anatomy of the major organ systems of the body. It aims to meet the requirements of students of Medicine, Dentistry, Histopathology, Mammalian Biology and the Paramedical Sciences. The subjects have been chosen to complement a program of physiology and dissection or prosection. Basic concepts of cell and tissue biology are presently considered in separate prerequisite units integrated with biochemistry and genetics and are not included in this text. The approach has been to focus on unique features or diagnostic differences between cells, their function and organisation into organs rather than on pure morphologic description.

Developmental aspects of certain organs have been described where these contribute to understanding functional relationships between cells in organ systems. A uniform text structure (point form) helps the reader to organise, review and retain pertinent information. A summary precedes each chapter which helps to focus on key concepts. Each topic is also prefaced by a list of objectives which serve as a guide for review. In addition, a list of key words (bold in the text), phrases and concepts that should be defined as a result of reading the text. The terminology follows that in contemporary use giving alternative names according to Nomina Histological where possible. A series of plates illustrates in line drawings the major features of cells in organs based on electron micrographs. In addition, tables show functional relationships between cells or their products.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.
