OpenGL® Shading Language, Third Edition, extensively updated for OpenGL 3.1, is the experienced application programmer's guide to writing shaders. Part reference, part tutorial, this book thoroughly explains the shift from fixed-functionality graphics hardware to the new era of programmable graphics hardware and the additions to the OpenGL API that support this programmability. With OpenGL and shaders written in the OpenGL Shading Language, applications can perform better, achieving stunning graphics effects by using the capabilities of both the visual processing unit and the central processing unit. In this book, you will find a detailed introduction to the OpenGL Shading Language (GLSL) and the new OpenGL function calls that support it. The text begins by describing the syntax and semantics of this high-level programming language. Once this foundation has been established, the book explores the creation and manipulation of shaders using new OpenGL function calls. OpenGL® Shading Language, Third Edition, includes updated descriptions for the language and all the GLSL entry points added though OpenGL 3.1, as well as updated chapters that discuss transformations, lighting, shadows, and surface characteristics. The third edition also features shaders that have been updated to OpenGL Shading Language Version 1.40 and their underlying algorithms, including Traditional OpenGL fixed functionality Stored textures and procedural textures Image-based lighting Lighting with spherical harmonics Ambient occlusion and shadow mapping Volume shadows using deferred lighting Ward's BRDF model The color plate section illustrates the power and sophistication of the OpenGL Shading Language. The API Function Reference at the end of the book is an excellent guide to the API entry points that support the OpenGL Shading Language.

With the recent advent of 3D graphics hardware for personal computer (PC), it is worthwhile to exploit the cost effectiveness and OpenGL performance issues among currently available

commercial off-the-self (COTS) computers. Graphics hardware vendors typically list several gross measurements of system performance when releasing new graphics hardware. Often these coarse or subjective figures do not represent how a software application performs. On the other hand, one seldom sees the same benchmark performed on machines across multiple platforms and operating systems, i.e., Intel-based PCs and RISC-based UNIX workstations. This document reports the results obtained from running two OpenGL benchmark programs, SPECviewperf 6.1.2 and SPECglperf 3.1.2, on existing computer workstations at ARL.
