System Identification is a special section of the International Federation of Automatic Control (IFAC)-Journal Automatica that

contains tutorial papers regarding the basic methods and procedures utilized for system identification. Topics include modeling and identification; step response and frequency response methods; correlation methods; least squares parameter estimation; and maximum likelihood and prediction error methods. After analyzing the basic ideas concerning the parameter estimation methods, the book elaborates on the asymptotic properties of these methods, and then investigates the application of the methods to particular model structures. The text then discusses the practical aspects of process identification, which includes the

usual, general procedures for process identification; selection of input signals and sampling time; offline and on-line identification; comparison of parameter estimation methods; data filtering; model order testing; and model verification. Computer program packages are also discussed. This compilation of tutorial papers aims to introduce the newcomers and non-specialists in this field to some of the basic methods and procedures used for system identification. Project Report from the

year 2012 in the subject Library Science, Information- / Documentation Science, printed single-sided, grade: -, Kampala International University - Dar-es-salaam College (computer studdies), course: none, language: English, comment: I undertook this project together with my student and friend mwadawa sadallar. She was very supportive especially in the design of the system. Finally she graduated with a degree of IT. i have a degree in computer science, masters of MIS, and am currently pursuing a PhD of information systems. Am a lecturer of Artificial intelligence, compiler construction, programing and information systems.,

abstract: For many years, universities & colleges have used file based / manual system to manage library use. Whereas this was quite efficient for some time, due to the expansion of the library and increase in the number of students, the system wastes a lot of time especially when searching for a particular book or resource. In response to this problem, more librarians have been added (employed), and this has escalated the cost of managing the library. This inefficiency, led to the study that was aimed at automating the book keeping function of the library. A study was carried out at Kampala International University Dar salaam Campus and it was discovered that the manual

system had inefficiencies ranging from time wastage, high cost of operation in terms of human resources, long search time, data redundancy among others. A computer based library management system was developed using visual studio. The new system allows the user to add books into the system, search for books from the system database, track member information, manage borrowing among others. By automating library operations, the university will enjoy the advantages of using databases and transaction processing systems.
