This Open access book offers updated and revised information on vessel health and preservation (VHP), a model concept first published in poster form in 2008 and in JVA in 2012, which has received a great deal of attention, especially in the US, UK and Australia. The book presents a model and a new way of thinking applied to vascular access and administration of intravenous treatment, and shows how establishing and maintaining a route of access to the bloodstream is essential for patients in acute care today. Until now, little thought has been given to an intentional process to guide selection, insertion and management of vascular access devices (VADs) and by default actions are based on crisis management when a quickly selected VAD fails. The book details how VHP establishes a framework or pathway model for each step of the patient experience, intentionally guiding, improving and eliminating risk when possible. The

evidence points to the fact that reducing fragmentation, establishing a pathway, and teaching the process to all stakeholders reduces complications with intravenous therapy, improves efficiency and diminishes cost. As such this book appeals to bedside nurses, physicians and other health professionals.

This book is open access under a CC BY 4.0 license. This textbook, endorsed by the European Society for Blood and Marrow Transplantation (EBMT), provides adult and paediatric nurses with a full and informative guide covering all aspects of transplant nursing, from basic principles to advanced concepts. It takes the reader on a journey through the history of transplant nursing, including essential and progressive elements to help nurses improve their knowledge and benefit the patient experience, as well as a comprehensive introduction to research and auditing methods. This new volume specifically intended for nurses, complements the ESH-EBMT reference title, a popular educational resource originally developed in 2003 for physicians to accompany an annual training course also serving as an educational tool in its own right. This title is designed to develop the knowledge of nurses in transplantation. It is the first book of its kind specifically targeted at nurses in this specialist field and acknowledges the valuable contribution that nursing makes in this area. This volume presents information that is essential for the education of nurses new to transplantation, while also offering a valuable resource for more experienced nurses who wish to update their knowledge.

Americans have become so accustomed to following doctors' orders that many prescriptions, medical tests, and surgical procedures are accepted without question. This blind faith can be dangerous! Modern medicine offers us a wide range of powerful treatments for ailments large and small. But did you know that some common "cures" come with serious, life-threatening risks, or may do nothing at all? This book contains much more vital information you need to know to take charge of your health--before you see your doctor. Includes information on: cholesterol-lowering medications; high-strength asthma inhalers; steroids; antibiotics; and Ritalin. Some startling facts you should know: Some cholesterol-lowering medications can actually increase your chances of dying. The rise in asthma deaths may be linked to high-strength inhalers. In some cases, it's safer to do nothing than have surgery for prostate cancer. Steroids, now widely prescribed for many minor conditions, can cause immediate, permanent, debilitating damage. Bone scans to screen for

osteoporosis are imprecise, often inaccurate, and may not signify anything. In the overwhelming majority of cases, antibiotics are prescribed for conditions they cannot treat. Ritalin, taken by as many as a million American children, has questionable benefits, numerous side effects, and a high potential for addiction or abuse. P> The U.S. National Institutes of Health estimate that 90% of patients who undergo bypass surgery receive almost no benefits. and much more vital information you need to know--before you see your doctor.

Recent developments have spurred a renewed interest in novel solutions to access the patient circulation, mainly concentrating on vascular access for renal replacement therapies and on peritoneal dialysis access. Starting with the epidemiology, the focus then shifts to the evolution of new techniques and monitoring procedures with regard to hemodialysis, which are discussed and evaluated. Attention is also paid to the new biomaterials available, concentrating on their improved biocompatibility and surface characteristics. As developments in the field of peritoneal dialysis have taken a similar turn, new devices providing access to the peritoneal cavity which have recently been made available are introduced next. Last but not least, the management of complications and the continuous maintenance and care of the access with regard to both hemodialysis and peritoneal dialysis are highlighted. This book provides a complete overview of the devices, catheters and methods currently available to ensure successful vascular and peritoneal access. Taking into account both the physiology of the extracorporeal circulation and the mechanisms of peritoneal dialysis with regard to the most adequate access techniques, this is a unique resource for clinicians, investigators and researchers in the field of renal replacement therapy.

The volume is authored by a colorectal surgeon with long-standing clinical and scientific experience and is devoted to the management of complications following surgery of the anorectum and the pelvic floor. It is aimed not only at general surgeons, perineologists and, of course, proctologists, but also at gastroenterologists, endoscopists, radiologists and physiotherapists, i.e. those who may be involved in both diagnosis and cure whenever an adverse event, either unpredictable or potentially preventable, causes an intra- or postoperative, early or late, mild or life-threatening complication. Severe bleeding, dehiscence, perforation, anorectal stricture, fecal incontinence, and even caval vein thrombosis, fatal Fournier gangrene and pneumomediastinum may occur after anal surgery. The incidence, pathogenesis prevention and treatment of such events are discussed in detail in 10 chapters with 30 tables, 200 illustrations and more than 1000 references. Both conventional procedures and recent innovations are reported. "Unforgettable clinical cases (complications with litigation)" and "Tips and Tricks" are sections increasing the appeal of this book. The approach is "evidence-based" and holistic, focusing on anorectal problems while taking into consideration whole body-mental unity—showing, for example, that a non-healing perineal wound may be due to hypo-pituitarism, and failure after a re-intervention may be related to psychological distress.

Since their first application in 1982, Totally Implantable Venous Access Devices (TIVADs) have become increasingly important in the clinical practice, as more intensive chemotherapy and parenteral treatments have come into use. At this time, there is objective evidence that TIVADs are a safe, effective strategy for long-term venous access; they play a significant role throughout the management of the oncology patient, as they are needed in the initial phases for active treatments as well as in the last stages for palliative measures, making possible repeated administration of chemotherapeutic vesicant agents, nutrients, antibiotics, analgesics, and blood products. According to a number of prospective studies, use of TIVADs is associated with a significant complication rate (10% to 25% of all patients). Evidence-based data support that most complications are directly related to inappropriate technique of placement and/or nursing care, sometimes leading to TIVAD loss, significant morbidity, increased duration of hospitalization, and additional medical cost. A group of world-renowned experts - both in the clinical and research fields - contributed to this volume, whose aim is to provide clinicians, nurses and medical students with a multidisciplinary, full update on these devices, as long term central venous access can no be longer considered a routine matter, and serious complications can be maintained at a very low level only if strict adherence to a well-defined protocol of surgical technique and of catheter care is maintained.
