An excursion into Markov chains | Marco Ferrante | Springer A Markov chain is a stochastic model describing a sequence of possible events in which the probability of each event depends only on the state attained in the previous event. A countably infinite sequence, in which the chain moves state at discrete time steps, gives a discrete-time Markov

chain (DTMC). A continuous-time process is called a continuous-time Markov chain (CTMC). In probability, a (discrete-time) Markov chain (DTMC) is a sequence of random variables, known as a stochastic process, in which the value of the next variable depends only on the value of the current variable, and not any variables in the past.
