Life with a potted plant is undeniably better. And better yet is the ability to grow and replicate new, healthy houseplants without ever having to visit a garden centre again. Learn to share, swap and celebrate the miraculous methods of multiplying all of your favourites at almost no cost at all. And here's the secret: it's really, really easy. Plants are designed to multiply. They spread their roots, send off inquisitive shoots, and regenerate themselves in all sorts of exciting and unexpected ways without any help. Even for the beginner indoor gardener, a single leaf can hold enough life to be successfully grown into a brand new plant. With *Root, Nurture, Grow*, you'll quickly discover how to propagate any houseplant, take cuttings, cultivate runners and offsets, divide plants at the roots and even grow brand new root systems in the air. You'll learn pruning methods that produce no waste, organic rooting medium recipes, and eventually enjoy gifting and swapping newly grown greenery with friends, family and other houseplant hoarders you'll meet along the way. As well as myriad propagation methods, the book includes practical DIY projects to better nurture and display your plant family, including a homemade propagation chamber and simple self-watering planters.

Before we can place our leaves on soil to begin growing new plants we must let the ends dry out and callous over. This step is vital! If you don't let the ends dry out and place them directly on soil they will absorb too much moisture and they will rot and die. In addition to letting the leaves callous over, we must also let the end of the stem on the rosette dry out as well. This could take anywhere from a few days to a week or so. Once you feel like the ends are dry enough, you can place them on top of some well-draining cactus or succulent soil. (Some people dip the ends in a rooting hormone, but I've never tried this and have had great success without it.) I've had the best results when keeping my leaves indoors in a window with lots of indirect sunlight. After a few weeks you will see little pink roots sprouting from the ends of the leaves and then teeny tiny baby plants will begin to grow. I water the leaves very rarely until I start to see roots or babies appearing. At this point I will give the roots or baby plants a good soak about once a week or whenever I notice the soil is totally dry. Just like with a fully developed succulent, too much water is not good. If you want to be certain not to over water, I recommend spraying the ends of your leaves with a spray bottle once a day instead of completely soaking the soil.

You can simply take a leaf that has fallen from your succulents or gently remove one off the stem. Make sure to use a twisting motion to pull the leaf off the plant entirely and avoid breaking it. Poor cuttings can result in the leaves not being able to sprout roots. Put the leaves on a paper towel until the cut ends dry out so that they will not rot when planted. After a couple of days letting the leaves dry on the paper towel, transfer them to lay on top of some succulent or cactus potting soil. Give the leaves bright and filtered sunlight as well as mist them with water whenever the soil dries out, probably a couple times a week. Roots will start sprouting and baby plants will appear after a few

weeks! When the baby plant reaches about half an inch tall and the original leaf dries up, gently remove the leaf, scoop the baby plant out of the soil and replant it in a pot. Avoid causing too much distress to the roots, which eventually need to be covered with soil.

Succulents are plants with fleshy, thickened leaves and/or swollen stems that store water. The word "succulent" comes from the Latin word *sucus*, meaning juice or sap. Succulents are able

to survive on limited water resources, such as dew and mist, making them tolerant of drought. There are many different species and cultivars of succulents spanning several plant families, and most people associate succulents with Cactaceae, the cactus family. (Keep in mind, however, that while all cacti are succulents, not all succulents are cacti.) Because of their special ability to retain water, succulents tend to thrive in warm, dry climates and don't mind a little neglect. This makes them well adapted to indoor growing and ideal for people desiring low-maintenance houseplants. Such thick parts of the plant may look peculiar or striking, making them an exciting visual accent. In nature, succulents can grow exceptionally large, though at home they tend to be smaller. They're a diverse bunch - some may begin life as tiny as a tablespoon, while many can live in a pot that sits comfortably on a side table or countertop, and others may grow a few feet high or more. Succulents are adept at propagating. Some will drop leaves, or plantlets, which are ready to grow on their own. You can also create plantlets by cutting a leaf or stem. Let the pieces dry for a few days, and soon roots will start to sprout, which is the signal they are ready to be planted. They also add water to the air, an act especially beneficial during the drier, colder, and darker months that help to prevent sore throats and dry skin. Moreover, there are any number of studies out there that indicate having plants around can improve wellness, enhancing a space to make it feel warmer and hospitable.
