ALKYDS ARE SYNTHETIC POLYMERIC MATERIALS that have been used in the coating industry since the 1930s. Today, they continue to be workhorse polymers for the paint, coating, and printing ink industries. Alkyds and chemically modified alkyd resins are the condensation products of poly-basic acids and polyhydric alcohols. They are used in liquid organic coatings for the architectural, industrial, automotive, and industrial maintenance markets. Alkyds are also known as oil-modified polyesters because of the presence of vegetable or marine oils or other fatty acids. These oils are coreacted into the polyester backbone. The type of oil or fatty acid present in the alkyd contributes to its oxidative cure characteristics. In a chemical sense, alkyds are polyesters that are formulated with drying or nondrying oils. In contrast, polyesters are oil free. Alkyds are often modified with other polymeric materials for particular property attainment. Three major classifications of alkyds are those designed for conventional solids, higher solids, and water-

borne coatings. Because there are a large variety of commercially available intermediates and chemical modifiers, *id est*, monomers, for the preparation of alkyds, they continue to be a very versatile type of polymers for coatings and printing inks. Most alkyds are film-forming polymers with a relatively low glass transition temperature (T_g), *id est*, below 0°C. They have inherently excellent pigment wetting characteristics and readily accept additives to form coatings with a wide range of appearance, performance, and application characteristics. Alkyds and modified alkyds have a good combination of hardness and flexibility, very acceptable corrosion resistance, good gloss retention, good adhesion to ferrous and nonferrous metals, and other properties that make them acceptable for use on wood, metal, plastic, composite, and other substrates. They are used in areas such as architectural coatings, automotive under-body and under-hood coatings, coil coatings, drum and metal container coatings, electrical insulating enamels, exterior trim paints, maintenance paints, and similar end uses. Alkyd technology has generally evolved slowly over the past few decades. The past few years have shown that technology advances have been made to (a) increase the performance of higher solids alkyds, (b) develop new methods for delivering alkyds in water, and (c) around blend

and hybridization science involving other chemistries. Polyesters used in coatings are reaction products of polyhydric alcohols and polybasic acids. Synthetic formulators have the luxury of selecting a variety of multifunctional reactants depending on end use applications, required economics, and coating performance needs.

ALKYD RESINS, COMMONLY KNOWN AS ALKYDS,, are synthetic

polymeric materials that have been used in the coating industry

since the 1930s. Today they continue to be the "workhorse"

polymers for the paint, coating, and printing ink industries. Alkyd

and chemically modified alkyd polymers find use in most types of

liquid organic coatings for architectural, air-dry, and baked

industrial and maintenance coatings. Alkyds are a special class of

polyesters that often have vegetable oil or fatty acids coreacted

into the polyester, and these compounds provide the distinctive

air-cure feature of many of these compounds.

A smart coating is defined as one that changes its properties in

response to an environmental stimulus. The Handbook of Smart

Coatings for Materials Protection reviews the new generation of

smart coatings for corrosion and other types of material

protection. Part one explores the fundamentals of smart coatings

for materials protection including types, materials, design, and

processing. Chapters review corrosion processes and strategies

for prevention; smart coatings for corrosion protection;

techniques for synthesizing and applying smart coatings; multi-

functional, self-healing coatings; and current and future trends of

protective coatings for automotive, aerospace, and military

applications. Chapters in part two focus on smart coatings with

self-healing properties for corrosion protection, including self-

healing anticorrosion coatings for structural and petrochemical

engineering applications; smart self-healing coatings for

corrosion protection of aluminum alloys, magnesium alloys and

steel; smart nanocoatings for corrosion detection and control;

and recent advances in polyaniline-based organic coatings for

corrosion protection. Chapters in part three move on to highlight

other types of smart coatings, including smart self-cleaning

coatings for corrosion protection; smart polymer nanocomposite

water- and oil-repellent coatings for aluminum; UV-curable

organic polymer coatings for corrosion protection of steel; smart

epoxy coatings for early detection of corrosion in steel and

aluminum; and structural ceramics with self-healing properties.

The Handbook of Smart Coatings for Materials Protection is a

valuable reference for those concerned with preventing

corrosion, particularly of metals, professionals working within the

surface coating industries, as well as all those with an academic

research interest in the field. Reviews the new generation of

smart coatings for corrosion and other types of material

protection Explores the fundamentals of smart coatings for

materials protection including types, materials, design, and

processing Includes a focus on smart coatings with self-healing

properties for corrosion protection

Organic Coatings is the first complete history of coatings science

and technology in one comprehensive volume. Eminent coating

pioneers who led the development of decorative and protective

coatings, ranging from the earliest oleoresinous paints to modern

polyurethane coatings. In addition to historical background, the

contributions include valuable practical information on coating

properties, structure, equipment, testing and applications, along

with illustrations and tables to supplement the text. This book will

be highly accessible to readers with only a cursory background

knowledge of chemistry. Organic Coatings provides the

background necessary to understanding modern coatings, with a

compelling look ahead to coatings of the future.

The definitive guide to organic coatings, thoroughly revised and

updated—now with coverage of a range of topics not covered in

previous editions Organic Coatings: Science and Technology,

Fourth Edition offers unparalleled coverage of organic coatings

technology and its many applications. Written by three leading

industry experts (including a new, internationally-recognized

coatings scientist) it presents a systematic survey of the field,

revises and updates the material from the previous edition, and

features new or additional treatment of such topics as

superhydrophobic, ice-phobic, antimicrobial, and self-healing

coatings; sustainability, artist paints, and exterior architectural

primers. making it even more relevant and useful for scientists

and engineers in the field, as well as for students in coatings

courses. The book incorporates up-to-date coverage of recent

developments in the field with detailed discussions of the

principles underlying the technology and their applications in the

development, production, and uses of organic coatings. All

chapters in this new edition have been updated to assure

consistency and to enable extensive cross-referencing. The

material presented is also applicable to the related areas of

printing inks and adhesives, as well as areas within the plastics

industry. This new edition Completely revises outdated chapters

to ensure consistency and to enable extensive cross-referencing

Correlates the empirical technology of coatings with the

underlying science throughout Provides expert troubleshooting

guidance for coatings scientists and technologists Features

hundreds of illustrative figures and extensive references to the

literature A new, internationally-recognized coatings scientist

brings fresh perspective to the content. Providing a broad

overview for beginners in the field of organic coatings and a

handy reference for seasoned professionals, Organic Coatings:

"I would like now to write a practical book that will cover three

topics: boats, the sea, and the beachcombing life." These were

the thought of Bernard Moitessier after he finished writing his last

book, *Tamata and the Alliance*, while in Polynesia. The great

master died in 1994 and never completed the book, but here it is,

meticulously collected from his many writings, published and

unpublished, by his companion Véronique Lerebours Pigeonnière. Moitessier's notebooks include all the know-how and the 1001 tips of this legendary sailor, the knowledge he acquired on the water, in meeting with sailors, during long passages, and during his many years living on various islands. The first part of the book details how to prepare for an extensive cruise, what kind of boat to choose, the rigging, the sails, the anchors, on deck and below deck. The second part describes the passage: the weather, navigation, watch-keeping, and heavy weather. In the third part, Moitessier takes us to the South Sea islands and shows how to adapt to living on an atoll, gardening, fishing and attaining self-sufficiency.

Engineers on major building projects continue to echo the sentiment that "painting amounts to 10% of the job, but provides 90% of the problems". This second edition of *Steelwork Corrosion Control* provides sound advice and authoritative guidance on the principles involved and methods of achieving sound steel protection. Taking into account the considerable developments in the paint protection industry, *Steelwork Corrosion Control* has been comprehensively updated to include new materials and coating systems, and the number of new ISO / BS / European standards and codes of practice on paints and painting, health and safety, and environmental issues. It is a must-have guide for engineers, architects and designers for whom the protection of structural steelwork is an important, albeit relatively minor, part of their professional activities. David Deacon is the President Elect of the Institute of Corrosion and a Fellow of FTCS (Fellowship of Technical Service Coating). Derek Bayliss is a Past President of the Institute of Corrosion and has served as Chairman of BS 5493 (concerned with coating structures against corrosion).

Oleochemical Manufacture and Applications John Wiley & Sons

This book builds up on the success of the first edition of *Paints, Coatings, and Solvents*. The first edition has been completely revised, the second edition thus is an up-to-date overview of the industrial aspects of paints, coatings, and solvents including composition, production, processing, uses, and methods of analysis. Special attention is given to toxicology and environmental protection matters. From reviews of the first edition: 'The publisher has successfully gathered together authors of international renown' (Current Engineering Practice) 'This book is a valuable read for anyone interested in this field' (Composites in Science and Technology) 'This work serves not only as a concise practical guide but is also an authoritative reference book essential to all chemists and chemical engineers working with paints, coatings, and solvents.' Most boatowners will find themselves with paintbrush in hand at least once during a season but with the vast range of products now available, how do you know which to select for the job? This book answers all the DIY boatowner's questions, and provides practical advice on painting every type of material. It explains: correct surface preparation dealing with defects correct application methods estimating quantities drying times brushes, rollers, pads and sprays resins, epoxies, solvents and thinners colour matching. There is also a handy fault-finding section for when things go wrong. 'This is a brilliant book... I recommend it for beginner and old-timer alike' *Cruising*

Irritant dermatitis is a common condition, accounting for a significant proportion of occupational skin disease. The recent advent of non-invasive skin bioengineering technology has accelerated dermatology research in this field. This book

comprises an exhaustive reference text on irritant contact dermatitis, covering all aspects of the condition: clinical features, epidemiology, prevention and therapy, prognosis, mechanisms, pathology and regulatory issues. The book also presents novel in vitro and in vivo research techniques and findings. As irritant dermatitis affects multiple specialties, the audience for this book is wide, including clinical and investigative dermatologists, allergists, toxicologists, pharmaceutical scientists, occupational and environmental physicians, public health physicians, cosmetologists and skin bioengineers.

This review describes the process of life cycle analysis in some detail. It describes the different organisations involved in researching and applying these techniques and the database resources being used to generate comparative reports. The overview explains the factors to be considered, the terminology, the organisations involved in developing these techniques and the legislation which is driving the whole process forward. The ISO standards relating to environmental management are also discussed briefly in the document. Design for the environment is covered in the report. This review is accompanied by summaries of selected papers on life cycle analysis and environmental impact from the Rapra Polymer Library database.

Oleochemical Manufacture and Applications presents an overview of oleochemicals at the research and professional levels, with an emphasis on industrial production and applications.

Approximately half of the chapters consider general matters, while the other half deal with applications. Authors are drawn from industrial and academic laboratories around the world. The book is an invaluable reference for chemists and technologists working on the production and use of oleochemicals, analytical chemists, quality assurance personnel, and lipid chemists in academic research laboratories.

Forensic Science Handbook, Volume I

Originally published in 1982 by Pearson/Prentice-Hall, the *Forensic Science Handbook, Third Edition* has been fully updated and revised to include the latest developments in scientific testing, analysis, and interpretation of forensic evidence. World-renowned forensic scientist, author, and educator Dr. Richard Saferstein once again brings together a contributor list that is a veritable Who's Who of the top forensic scientists in the field. This Third Edition, he is joined by co-editor Dr. Adam Hall, a forensic scientist and Assistant Professor within the Biomedical Forensic Sciences Program at Boston University School of Medicine. This two-volume series focuses on the legal, evidentiary, biological, and chemical aspects of forensic science practice. The topics covered in this new edition of Volume I include a broad range of subjects including: • Legal aspects of forensic science • Analytical instrumentation to include: microspectrophotometry, infrared Spectroscopy, gas chromatography, liquid chromatography, capillary electrophoresis, and mass spectrometry • Trace evidence characterization of hairs, dust, paints and inks • Identification of body fluids and human DNA This is an update of a classic reference series and will serve as a must-have desk reference for forensic science practitioners. It will likewise be a welcome resource for professors teaching advanced forensic science techniques and methodologies at universities world-wide, particularly at the graduate level.

This book aims to provide readers with the latest and relevant trends in corrosion. Use of inhibitors is one of the most common, cheap, and globally followed methods for the protection of metals

from aggressive solutions. The information contained in this book covers different corrosion inhibitors for different corrosive environments with sufficient experimental data, surface studies, and theoretical studies. These studies altogether will give readers

a good view of the basic and advanced knowledge of corrosion inhibitors and will be of interest to students, academicians, and industrialists.
