Of all the techniques
used to treat non
melanoma skin cancer,
the highest cure rates
belong to the Mohs
surgical procedure.

Critical to this technique is optimal preparation and interpretation of frozen sections. With more than 400 high resolution figures, the Atlas of Mohs and Frozen Section Cutaneous Pathology is the premier textbook on the topic, serving as a highly practical guide to microscopic analysis, diagnosis, and discrimination of common and problematic cutaneous neoplasms. Highlights of the Atlas include diagnosis of basic and routine dermatologic entities, diagnosis and distinction of rare and/or deadly neoplasms such as dermatofibrosarcoma protuberans and merkel cell carcinoma, a troubleshooting guide dealing with quality control of the

frozen section technique, and discussion of new techniques including immunohistochemistry. Comprehensive and presented in full color, the Atlas of Mohs and Frozen Section Cutaneous Pathology is an indispensable reference for anyone involved with the Mohs procedure, including dermatologic surgeons, Mohs cutaneous surgeons, as well as pathologists and dermatopathologists who perform frozen section analysis of cutaneous specimens. Dermatopathology is a subspecialty of both dermatology and pathology that studies causes and effects of skin disorders at a microscopic level. This colour atlas is a comprehensive guide to the diagnosis and management of dermatological disorders by correlating pathological results with clinical features. Written from

the perspective of both pathologists and dermatologists, the book begins with an introduction to the normal pattern of skin. Each of the following chapters examines a different skin disorder, first providing a detailed description of the disease and its clinical features, then criteria for diagnosis, differential diagnosis and potential pitfalls. Written by an internationally recognised author team from Utah and Pennsylvania, this invaluable guide is highly illustrated with nearly 800 clinical and histological photographs with detailed descriptions. Based on Lever's Histopathology of the Skin, Ninth Edition, this full-color atlas presents an algorithmic pattern recognition approach to differential diagnosis of skin diseases.

Whereas Lever's classifies diseases by pathogenesis, this atlas aids in differential diagnosis of unknown cases by classifying diseases morphologically, based on their location in the skin and the patterns and cell types seen through the microscope. Within each morphologic category, prototypic disorders are described and illustrated with full-color photomicrographs, and a list of differential diagnostic possibilities is presented. The atlas contains over 1,300 full-color illustrations. A bound-in image bank CD-ROM contains all the book's illustrations.

Improve your dermatological diagnostic accuracy. The most efficient method in the diagnosis of skin diseases is the combined validation of clinical and histopathological features. The results of biopsy investigation in isolation don't always yield answers. But when considered together, the clinical pattern and the histopathology, then diagnosis can become clearer. In this process the diagnostic impact of histopathology may be decisive or just confirmative to the clinical differential diagnosis. The structure of the book follows a basic approach to

morphology, which is overall orientation at scanning magnification first, then identifying a prototypic pattern, and finally finding the essential diagnostic clue(s) under high power magnification. **Dermatopathology: Practical Differential Diagnosis by Clinicopathologic Pattern** provides top quality images to correlate clinical presentations with histopathologic features. Annotated images highlight subtle indications that can clinch the diagnosis. Concise, bullet-pointed text provides further context. Written by internationally renowned authors, the book is ideal for anyone involved in the diagnosis of skin disease.
