This book focuses on the materials used for dental applications looking at the fundamental issues and the developments that have taken place the past decade. While it provides a broad overview of dental materials, the chemicals that are used for the preparation and fabrication of dental materials are explained as well. Also, the desired properties of these materials are discussed and the relevance of the chemical, physical, and mechanical properties is elucidated. Methods for the characterization and classification, as well as clinical studies are reviewed here. In particular, materials for dental crowns, implants, toothpaste compositions, mouth rinses, as well as materials for toothbrushes and dental floss are discussed. For example, in toothpaste compositions, several classes of materials and chemicals are incorporated, such as abrasives, detergents, humectants, thickeners, sweeteners, coloring agents, bad breath reduction agents, flavoring agents, tartar control agents, and others. These chemicals, together with their structures, are detailed in the text. *Materials for the Direct Restoration of Teeth* Springer Science & Business Media

This essential textbook introduces dental students to dental materials used in virtually all restorative dentistry procedures, from cavity fillings and root canals to making impressions or replicas of teeth and tissues prior to constructions of dentures. It details the properties and applications of materials such as metals, ceramics, polymers and composites. The new edition offers a basic understanding of the technology behind dental materials, emphasizes communication with the dental laboratory, and points out how to recognize whether the laboratory is producing quality output. Comprehensive and readable coverage addresses issues related to the composition, handling, and application of materials used by dentists in clinical practice. The necessary basic science is presented in a clear and understandable manner. The final section covers what the dentist needs to know about laboratory materials used by technicians in the construction of dental prostheses. New sections incorporate information on resin modified glass ionomer cements, polyacid modified resin composites, and luting systems. Sections on endodontics and dental ceramics have been extensively updated. New emphasis has been placed on quality issues, enabling the dentist to identify problems with impressions taken for dentures and to know whether the laboratory will be able to work with them.

New nanomaterials are leading to a range of emerging dental treatments that utilize more biomimetic materials that more closely duplicate natural tooth structure (or bone, in the case of implants). The use of nanostructures that will work in harmony with the body's own regenerative processes (eg, to restore tooth structure or alveolar bone) are moving into clinical practice. This book brings together an international team of experts from the fields of nanomaterials, biomedical engineering and dentistry, to cover the new materials and techniques with potential for use intra-orally or extra-orally for the restoration, fixation, replacement, or regeneration of hard and soft tissues in and about the oral cavity and craniofacial region. New dental nanotechnologies include the use of advanced inorganic and organic materials, smart and biomimetic materials, tissue engineering and drug delivery strategies. Book prepared by an interdisciplinary and international group of bio-nanomaterial scientists and dental/oral biomedical researchers Comprehensive professional reference for the subject covering materials fabrication and use of materials for all major diagnostic and therapeutic dental applications - repair, restoration, regeneration, implants and prevention Book focuses in depth on the materials manufacturing processes involved with emphasis on pre-clinical and clinical applications, use and biocompatibility

Braden and his coauthors give a comprehensive overview of the use of polymers and polymer composites as dental materials. These comprise polyelectrolyte based materials, elastomers, glassy and crystalline polymers and fibres. Such materials are used in dentistry as restorative materials, hard and soft prostheses, and impression materials. The chemistry of materials is reviewed, together with mechanical, thermal, visco-elastic and water solution properties. These properties are related to clinical performance, with emphasis on some of the difficulties inherent in developing materials for oral use. Indications are given of possible future developments.
