"This book is
designed to
help students
organize their
thinking about
psychology at
a conceptual
level. The
focus on

behaviour and
empiricism
has produced
a text that is
better
organized, has
fewer
chapters, and
is somewhat

shorter than many of the leading books. The beginning of each section includes learning objectives; throughout the body of each section are key terms in bold followed by their definitions in italics; key takeaways, and exercises and critical thinking activities end each section"-

 "Written for undergraduate psychology students, and assuming little knowledge of evolutionary science, the third edition of this classic textbook provides an essential introduction to evolutionary psychology. Fully updated

with the latest research and new learning features, it provides a thought-provoking overview of evolution and illuminates the evolutionary foundation of many of the broader topics taught in psychology departments. The text retains its balanced and critical evaluation of hypotheses and full coverage of the fundamental topics required for undergraduates. This new

edition includes more material on the social and reproductive behaviour of non-human primates, morality, cognition, development and culture as well as new photos, illustrations, text boxes and thought questions to support student learning. Nearly 300 online multiple choice questions complete the student questioning package. This new material complements

the classic features of this text, which include suggestions for further reading, chapter summaries, a glossary, and two-colour figures throughout"--
