Does Jesus Know Us? University of Toronto Press

A clinically relevant introduction focusing on those microbes that cause disease in humans. Following basic principles, basic concepts in the immune response, and general principles of laboratory diagnosis, sections cover bacteriology, virology, mycology and parasitology. Chapters in these sections begin with etiology, then discuss epidemiology, host defenses, identification, diagnosis, prevention, and control. Expanded information on immunology and a new chapter on arthropods are included. Annotation

For nearly 60 years, the tiny Mediterranean nation of Cyprus has taken a disproportionate share of the international spotlight. In *The Cyprus Problem*, James Ker-Lindsay--recently appointed as expert advisor to the UN Secretary-General's Special Advisor on Cyprus--offers an incisive, even-handed account of the conflict. Ker-Lindsay covers all aspects of the Cyprus problem, placing it in historical context, addressing the situation as it now stands, and looking toward its possible resolution.

The subject of the apallic syndrome is one which has long been familiar to me, although I have not personally studied it as deeply as I would have wished. I became acquainted with this syndrome long before the last war, when my neurosurgical colleague Hugh Cairns (1952), made his pioneer contribution under the term "akinetetic mutism". This was an ar resting title, but it was one which did not altogether satisfy some of his colleagues, includ ing myself. We found it difficult to suggest an alternative. That is one reason why I wel come the expression "apallic syndrome". Forensic practice has forced me from time to time

to consider rather more deeply this distressing syndrome, and to try and marshal my ideas in a form which would satisfy my colleagues in the legal profession. More than once I have been instructed to make a medico legal assessment of these unfortunate patients. The points which have concerned my lawyer friends have not been matters of diagnosis, or of morbid anatomy, or of etiology. The factual problem which has been put before me was to make some approximate assessment as to the expectation of life. Vague guess-work is unacceptable in such circumstances. What the lawyers require is a precise and dogmatic answer.

Here is a book for clinicians, clinical investigators, trainees, and graduates who wish to develop their proficiency in the planning, execution, and interpretation of clinical and epidemiological research. Emphasis is placed on the design and analysis of research studies involving human subjects where the primary interest concerns principles of analytic (cause-and-effect) inference. The topic is presented from the standpoint of the clinician and assumes no previous knowledge of epidemiology, research design or statistics. Extensive use is made of illustrative examples from a variety of clinical specialties and subspecialties. The book is divided into three parts. Part I deals with epidemiological research design and analytic inference, including such issues as measurement, rates, analytic bias, and the main forms of observational and experimental epidemiological studies. Part II presents the principles and applications of biostatistics, with emphasis on statistical inference. Part III comprises four chapters covering such topics as diagnostic tests, decision analysis, survival (life-table) analysis, and causality.

While systems biology and pharmacodynamics have evolved in parallel, there are significant interrelationships that can enhance drug discovery and enable optimized therapy for each patient. Systems pharmacology is the relatively new discipline that is the interface between these two methods. This book is the first to cover the expertise from systems biology and pharmacodynamics researchers, describing how systems pharmacology may be developed and refined further to show practical applications in drug development. There is a growing awareness that pharmaceutical companies should reduce the high attrition in the

pipeline due to insufficient efficacy or toxicity found in proof-of-concept and/or Phase II studies. Systems Pharmacology and Pharmacodynamics discusses the framework for integrating information obtained from understanding physiological/pathological pathways (normal body function system vs. perturbed system due to disease) and pharmacological targets in order to predict clinical efficacy and adverse events through iterations between mathematical modeling and experimentation.

Molecular Basis of Aging is a collection of papers that discuss the molecular aspects of aging in the light of molecular biology, biochemical gerontology, and genetics. Each chapter of the book contains a different study about the topic, which includes the effects of aging on DNA synthesis; the amplification of extrachromosomal circular copies and mitochondrial DNA during aging; and the altered actions of hormones and neurotransmitters during aging. The book also encompasses the loss of responsiveness to growth factors in cell senescence; the integration of cellular-molecular and neuroendocrine concepts of aging; changes and inactivation of enzymes during aging; and the relationship of aging with free radicals. The text is recommended for molecular biologists, biochemists, and gerontologists who wish to study further the effects of aging on the body on a molecular level.

Levinas's thought can make us tremble' exclaims Jacques Derrida, one of the increasing number of writers in many different fields through whose works reverberate shock waves transmitted by the prophetic words of this eminent contemporary philosopher. John Llewelyn's exemplary study hears in Levinas's words an argument to the effect that is ethics is in crisis today it is because we fail to acknowledge that there is crisis in ethics from all time. After Auschwitz, he asks, dare we leave unheeded what Levinas has to say?
