*The Anglo-Chinese Calendar Manual. A Handbook of Reference for the Determination of Chinese Dates During the Period from 1860 to 1869; with Comparative Tables of Annual and Mensual Designation, Etc. Compiled by W. F. Meyers* Penguin

Dates form the backbone of written history. But where do these dates come from? Many different calendars were used in the ancient world. Some of these calendars were based upon observations or calculations of regular astronomical phenomena, such as the first sighting of the new moon crescent that defined the beginning of the month in many calendars, while others incorporated schematic simplifications of these phenomena, such as the 360-day year used in early Mesopotamian administrative practices in order to simplify accounting procedures. Historians frequently use handbooks and tables for converting dates in ancient calendars into the familiar BC/AD calendar that we use today. But very few historians understand how these tables have come about, or what assumptions have been made in their construction. The seven papers in this volume provide an answer to the question what do we know about the operation of calendars in the ancient world, and just as importantly how do we know it? Topics covered include the ancient and modern history of the Egyptian 365-day calendar, astronomical and administrative calendars in ancient

Mesopotamia, and the development of astronomical calendars in ancient Greece. This book will be of interest to ancient historians, historians of science, astronomers who use early astronomical records, and anyone with an interest in calendars and their development.

The Moon Year is a fascinating recording of the mysterious and somewhat elusive traditions of the Chinese. Juliet Bredon and Igor Mitrophanow trace their way through the intimate life of Chinese religion, superstitions, philosophies, customs, and society. Only after a year's residence in China are the authors able to gather an intimate perspective on this age-old civilization that has withstood the test of time. Bredon and Mitrophanow unravel some of the puzzles that surround this fascinating culture, through detailed description of the everyday beliefs of the Chinese people and the festivals of their 'Moon Calendar, ' used as a diary of daily happenings. As the original printing of this book was in 1927, many of these rites may no longer exist, further emphasizing the importance of Bredon and Mitrophanow's work. Much of the material for The Moon Year was gathered first-hand from people they met along their journey, as well as from rare Chinese books and texts, resulting in a refreshingly honest exploration of a great civilization.

 This investigation is concerned with ancient Egyptian calendars. Its specific focus is one of the oldest problems of the study of these calendars: the so-called problem of the month names. This work's main purpose is to suggest an explanation for the Brugsch phenomenon. The Brugsch phenomenon is one of the two main aspects of the problem of the month names. The other is the Gardiner phenomenon. No new theory is presented for the Gardiner phenomenon. As a problem, the Brugsch phenomenon is slightly older than the Gardiner Phenomenon. It has occupied

center stage in the study of ancient Egyptian calendars since the early days of this endeavor. In 1870, Heinrich Brugsch, the great pioneer in this subject, wrote about the phenomenon, "Here we encounter all at once the most curious contradiction." Just recently, Rolf Krauss has described the contradiction as still "unsolved". The Brugsch phenomenon concerns the indisputable fact that the last or twelfth month of the Egyptian civil year can be named as if it were the first. Two month names are involved. The first is *wp rnpt*. Its meaning "opener of the year," refers to a beginning. The second month name is *mswt r'* "birth of Re" in hieroglyphic Egyptian, *Mesore* in Aramaic, Greek and Coptic. Both can otherwise also refer to New Year's Day, the quintessential calendrical beginning.

This Handbook is the first to study comprehensively how the Southeast Asian calendar was constructed and how positions for the sun, moon and planets were determined. It examines the differences that distinguish Burma from Thailand, Laos and Cambodia, and those that distinguish Northern Thailand from the rest of that country. Explanation of such matters as ways of naming the years, differences between the types of lunar year, variations in methods used to mark times of day, constructing horoscopes, determining calendar dates, and many other technical matters are accompanied by worked examples from the literature. The intention of the study is to provide an apparatus whereby scholars will be able to analyse confidently for themselves the dates and other calendrical information to be found in abundance in their sources.

The only small, popular book on the important subject of ancient calendars. The study of heavenly cycles is common to most ancient cultures. The ancient Egyptians, Chinese, and Babylonians all tried to make sense of the year. But it fell to the later Mesoamerican Maya to create a series of calendars that could be cross referenced. In doing so, the Maya discovered many strange numerical harmonics. Their lunar calendar was extremely accurate—far more so than the Greek Metonic cycle; they tracked Venus to an accuracy of less than a day in five hundred years and their tables could have been used to predict eclipses seven hundred years in the future. This book will provide a much needed compact guide to the Mayan calendar systems as well as covering the essentials of calendar development throughout the world.
