RailSys3.0 is a German railway simulation program that deals with this goal. In this paper, a railway network operation, with different suggested modifications in infrastructure, rolling stocks, and control system, using RailSys3.0, has been studied, optimized, and evaluated.

ArgeCare - Computer aided railway engineering

Computer aided casting methoding of railway system

An electrified railway system includes complex interconnections and interactions of several sub-systems. Computer simulation is the only viable means for system evaluation and analysis. This paper discusses the difficulties and requirements of effective simulation models for this specialized industrial application; and the development of a general-purpose multi-train simulator.

Computer applications in railway operation - ScienceDirect

This article presents a computer-aided multistage methodology for the simulation of railway ballasts using the Random Sequential Adsorption (RSA - 2D domain) paradigm. The primary stage in this endeavor is the numerical

generation of a synthetic sample by a “particle sizing and positioning” process followed by a “compaction” process.
