This book aims to explain how and why the detailed three-dimensional architecture of molecules can be determined by an analysis of the diffraction patterns obtained when X rays or neutrons are scattered by the atoms in single

crystals. Part I deals with the nature of the crystalline state, diffraction generally, and diffraction by crystals in particular, and, briefly, the experimental procedures that are used. Part II examines the problem of converting the experimentally obtained data into a model of the atomic arrangement that scattered these beams. Part III is concerned with the techniques for refining the

approximate structure to the degree warranted by the experimental data. It also describes the many types of information that can be learned by modern crystal structure analysis. There is a glossary of terms used and several appendixes to which most of the mathematical details have been relegated. *Reshaping Accounting and Management Control*

Il volume consente ai biologi di avvicinarsi al mondo della cristallografia, della mineralogia e della cristallochimica con efficacia e semplicità. Il testo fornisce le informazioni di base sulle caratteristiche dello stato "cristallino" e dei principali minerali, in particolare silicatici. Nello specifico vengono descritte due tecniche utilizzate per identificare le fasi cristalline: la spettroscopia micro-Raman, una tecnica estremamente semplice da un punto di vista sperimentale, e la microscopia elettronica a scansione con annessa microsonda chimica SEM/EDS, che ha la peculiarità di ottenere immagini ad altissimi ingrandimenti e spettri relativi alla composizione chimica dei campioni in esame. Particolare attenzione è rivolta all'applicazione di queste tecniche su sezioni istologiche per l'individuazione e la caratterizzazione degli amianti,

minerali che un rischio per la  
costituiscono considerevole salute umana.
