**Online Database Selection** New York, N.Y. : Cuadra/Elsevier  
 The first guide to show you how to power your site using Umbraco. More companies are turning to the power and simplicity of Umbraco's web content management system to build robust, customized sites. Written by leaders in the Umbraco community, this invaluable guide takes you through every aspect of this open source tool. Code samples using XHTML, CSS, XSLT, and C# are integrated throughout the pages to illustrate key concepts that you can apply. As you work through the chapters, you'll progress from building a basic Umbraco site to a sophisticated one that meets the needs of your organization. Umbraco User's Guide: Explains how to install Umbraco and walks you through its XML structure Discusses how to create templates while building your understanding of layouts Offers best practices for developing content, designing types, organizing templates, and using the rich text editor Walks you through XSLT and .NET controls Helps you build sample applications and troubleshoot any issues that arise Covers how to create your own classified ads site by combining document types, templates, styles, macros, and more

DEPOT has been developed to provide tracking for the Stanford Linear Collider (SLC) control system equipment. For each piece of equipment entered into the database, complete location, service, maintenance, modification, certification, and radiation exposure histories can be maintained. To facilitate data entry accuracy, efficiency, and consistency, barcoding technology has been used extensively. DEPOT has been an important tool in improving the reliability of the microsystems controlling SLC. This document describes the components of the DEPOT database, the elements in the database records, and the use of the supporting programs for entering data, searching the database, and producing reports from the information. *User's Guide and Thesaurus* M.E.N.U., the International Software Database User's Guide for DIALOG1995 Special Forces Assessment & Selection Database User's Guide and CodebookLongterm pavement performance information management system pavement performance database user reference guide

This document is a User's Guide intended for use by a database administrator responsible for creating mission databases using data collected at the Joint Readiness Training Center, Fort Chafee, AR. The software is suitable for use on a Digital Equipment Corporation VAX computer as configured at the Presidio of Monterey Field Unit of the U.S. Army Research Institute for the Behavioral and Social Sciences. It is intended for use at the ARI Presidio of Monterey Field Unit only.

The Solid Waste Projection Model (SWPM) system is an analytical tool developed by Pacific Northwest Laboratory (PNL) for Westinghouse Hanford Company (WHC) specifically to address Hanford solid waste management issues. This document is one of a set of documents supporting the SWPM

system and providing instructions in the use and maintenance of SWPM components. This manual contains instructions for preparing to use Version 1 of the SWPM database, for entering and maintaining data, and for performing routine database functions. This document supports only those operations which are specific to SWPM database menus and functions, and does not provide instructions in the use of Paradox, the database management system in which the SWPM database is established.

**INSPEC Database Users' Guide** DIANE Publishing

"This user's guide and reference document describes the physical features of the Salmon River Basin, Idaho, stream channels that represent "natural conditions" for fish habitat-that is, streams that have not been influenced by major human disturbances. The data base was created to assist biologists and resource managers. It describes resource conditions that can be achieved through management objectives."

**AGRICOLA User's Guide** John Wiley & Sons

This book discusses how to glean reliable data from paper and electronic documents, how to create a useful Concordance 8.0 database shell, how to load data into that shell using Opticon 3.0, and finally, how to obtain useful search results. Later chapters revisit these steps in finer detail. Coverage goes beyond technical discussion of recommended best practices to important topics such as establishing coding standards, locating reliable third party vendors, and exploiting complex search logic to aid in document review. By the end, readers will know how to deploy essential tool for document management on behalf of client users.

*Motor Master User Guide*

This publication is based on previous documentation of the nationally standardized Forest Inventory and Analysis database (Hansen and others 1992; Woudenberg and Farrenkopf 1995; Miles and others 2001). Documentation of the structure of the Forest Inventory and Analysis database (FIADB) for

Phase 2 data, as well as codes and definitions, is provided. Examples for producing population level estimates are also presented. This database provides a consistent framework for storing forest inventory data across all ownerships for the entire United States. Forest Inventory and Analysis (FIA) is a continuing endeavor mandated by Congress in the Forest and Rangeland Renewable Resources Planning Act of 1974 and the McSweeney-McNary Forest Research Act of 1928. FIA's primary objective is to determine the extent, condition, volume, growth, and depletion of timber on the Nation's forest land. Before 1999, all inventories were conducted on a periodic basis. The passage of the 1998 Farm Bill requires FIA to collect data annually on plots within each State. This kind of up-to-date information is essential to frame realistic forest policies and programs. USDA Forest Service regional research stations are responsible for conducting these inventories and publishing summary reports for individual States. In addition to published reports, the Forest Service provides data collected in each inventory to those interested in further analysis. This report describes a standard format in which data can be obtained. This standard format, referred to as the Forest Inventory and Analysis Database (FIADB) structure, was developed to provide users with as much data as possible in a consistent manner among States. A number of inventories conducted prior to the implementation of the annual inventory are available in the FIADB. However, various data attributes may be empty or the items may have been collected or computed differently. Annual inventories use a common plot design and common data collection procedures nationwide, resulting in greater consistency among FIA work units than earlier inventories. Data field definitions note inconsistencies caused by different sampling designs and processing methods.
