Engineering Science Butterworth-Heinemann
"This book is intended to prepare the engineering student to make the most effective use of the materials at his disposal. He is given a basic understanding of the makeup of real materials and the underlying theory that accounts for their behavior. The various areas of engineering application of materials are explored systematically at the same time that their behavior is shown to be a logical manifestation of theory. [...] The pattern followed throughout this book is first to discuss the general, then the specialized, aspects of materials and their applications."--Preface (page vii.)
Engineering Materials 3 Courier Dover Publications
Suitable for advanced undergraduates and graduate students in engineering, this text introduces the concepts of plasma physics and magnetohydrodynamics from a physical viewpoint. The first section of the three-part treatment deals mainly with the properties of ionized gases in magnetic and electric fields, essentially following the microscopic viewpoint. An introduction surveys the concepts of ionized gases and plasmas, together with a variety of magnetohydrodynamic regimes. A review of electromagnetic field theory follows, including motion of an individual charged particle and derivations of drift motions and adiabatic invariants. Additional topics include kinetic theory, derivation of electrical conductivity, development of statistical mechanics, radiation from plasma, and plasma wave motion. Part II addresses the macroscopic motion of electrically conducting compressible fluids: magnetohydrodynamic approximations; description of macroscopic fluid motions; magnetohydrodynamic channel flow; methods of estimating channel-flow behavior; and treatment of magnetohydrodynamic boundary layers. Part III draws upon the material developed in previous sections to explore applications of magnetohydrodynamics. The text concludes with a series of problems that reinforce the teachings of all three parts.
