 This manual presents an evidence-based focal psychodynamic approach for the outpatient treatment of adults with anorexia nervosa, which has been shown to produce lasting changes for patients. The reader first gains a thorough understanding of the general models and theories of anorexia nervosa. The book then describes in detail a three-phase treatment using focal psychodynamic psychotherapy. It provides extensive hands-on tips, including precise assessment of psychodynamic themes and structures using the Operationalized Psychodynamic Diagnosis (OPD) system, real-life case studies, and clinical pearls. Clinicians also learn how to identify and treat typical ego structural deficits in the areas of affect experience and differentiation, impulse control, self-worth regulation, and body perception. Detailed case vignettes provide deepened insight into the therapeutic process. A final chapter explores the extensive empirical studies on which this manual is based, in particular the renowned multicenter ANTOP study. Printable tools in the appendices can be used in daily practice. This book is of interest to clinical psychologists, psychotherapists, psychiatrists, counselors, and students.

 Meat and meat-based products play an important role as foods in the diets of people around the world. However, environmental and social issues have posed a challenge to meat production processing plants, with the advent of more consumer conscious production values across the food processing industry and a changing attitude among some communities towards the consumption of products from animal origin. The development of meat science and technology has brought solutions that allow the consumption of meat in a greater proportion from the source. Traditional processes such as salting, smoking, and fermentation have been refined, and, more recently, processes such as emulsification, marinating, and tenderizing of meat, have further diversified meat products. Meat processing technology is also required to meet consumer expectations and demands for nutritious and safe food. Consumer requirements have pushed for need for adaptation and modernization of slaughterhouses, as well as the use of more suitable processing technologies for saving water, energy, and reducing waste production, all while trying to provide a high level of nutritional, sensory, and food-safety for consumers. Advances in Meat Processing Technologies aims to inform students, researchers, lecturers and others who are interested in the subject, about new meat and meat-based product processing technologies. The handbook covers a variety

of meat processing technologies including dry fermentation, meat emulsification, curing, marinating, restructuring and processing of non-emulsified meat and meat analogues. Additional chapters cover the use of additives and ultrasound technology in meat processing as well as different strategies suitable for meat processing operations. The simple, topical presentation of the book, which covers a wide variety of products makes the book a key reference for informing students, researchers, lecturers, professionals and general readers who are interested in the subject of meat processing technology.

The first guide to this new financial trend. Credit securitization (also known as asset securitization) is a financial technology for packaging, underwriting, and selling loans in the form of securities. First used in packaging mortgage loans (as in the case of GNMA and other federally insured mortgage-backed securities), credit securitization has grown rapidly and spread to other forms of credit, including auto loans, student loans, credit-card balances, and so on. This book provides lenders and other financial professionals with clear analyses of many actual credit securitization deals. Includes much information unavailable elsewhere.

This volume reflects on the consequences of the increasingly globalized nature of our world for public sector management. Globalization has triggered rapid growth in trade, global financial transactions and cross-country ownership of economic assets. The implications of these multifaceted processes for the welfare of today's and tomorrow's societies are unclear. What is clear, however, is that an increasing number of problems are too complex to be tackled solely at the level of national states. As a result, the size, functions and modi operandi of the public sector in a globalized world are emerging topics in academia and practice.

Precancerous states provide valuable information about the natural history of some forms of malignant disease in man, and have important therapeutic implications in the identification of particular high-risk groups of patients and the introduction of screening procedures and early prophylaxis. However,

precancerous states are still poorly characterized, and one of the main aims of this book is to review the common precancerous lesions in a critical manner and to consider some of the newer techniques that may help to identify them more accurately in the future. The subject matter is presented on a conventional systematic basis, together with general chapters on genetic aspects and epidemiology and a final section dealing with broad principles of clinical management. Experimental studies are included whenever they contribute to the argument.
