 Manufacturing, reduced to its simplest
 form, involves the sequencing of product
 forms through a number of different
 processes. Each individual step, known as
 an unit manufacturing process, can be
 viewed as the fundamental building block
 of a nation's manufacturing capability. A

committee of the National Research
 Council has prepared a report to help
 define national priorities for research in
 unit processes. It contains an organizing
 framework for unit process families,
 criteria for determining the criticality of a
 process or manufacturing technology,
 examples of research opportunities, and a
 prioritized list of enabling technologies
 that can lead to the manufacture of
 products of superior quality at competitive
 costs. The study was performed under the
 sponsorship of the National Science
 Foundation and the Defense Department's
 Manufacturing Technology Program.
**Additive Manufacturing: Materials,
 Processes, Quantifications and
 Applications** Butterworth-Heinemann
 There are books aplenty on materials

selection criteria for engineering design.
 Most cover the physical and mechanical
 properties of specific materials, but few
 offer much in the way of total product
 design criteria. This innovative new
 text/reference will give the "Big picture
 view of how materials should be
 selected—not only for a desired function
 but also for their ultimate performance,
 durability, maintenance, replacement
 costs, and so on. Even such factors as how
 a material behaves when packaged,
 shipped, and stored will be taken into
 consideration. For without that knowledge,
 a design engineer is often in the dark as to
 how a particular material used in
 particular product or process is going to
 behave over time, how costly it will be,
 and, ultimately, how successful it will be at

doing what is supposed to do. This book delivers that knowledge. * Brief but comprehensive review of major materials functional groups (mechanical, electrical, thermal, chemical) by major material categories (metals, polymers, ceramics, composites) * Invaluable guidance on selection criteria at early design stage, including such factors as functionality, durability, and availability * Insight into lifecycle factors that affect choice of materials beyond simple performance specs, including manufacturability, machinability, shelf life, packaging, and even shipping characteristics * Unique help on writing materials selection specifications
