**Manual Determination Of Boiling Point**  
 Of Boiling point can be determined in a few different ways. If a reasonably large volume of sample is available, then the boiling point of the liquid can be determined using a simple distillation apparatus set-up (see simple distillation, technique T.6). **Determination of Boiling Point**  
 The boiling point is the temperature at which the vapor pressure of a liquid equals the external pressure surrounding the liquid. Therefore, the boiling point of a liquid depends on atmospheric pressure. The boiling point becomes lower as the external pressure is reduced.  
**Definition of Boiling Point in Chemistry**  
 The boiling point of a substance is the temperature at which the vapor pressure of a liquid equals the pressure surrounding the liquid and the liquid changes into a vapor.. The boiling point of a liquid varies depending upon the surrounding environmental pressure. A liquid in a partial vacuum has a lower boiling point than when that liquid is at atmospheric pressure.

 Determination of boiling point of a liquid organic compound. **Theory**  
 The boiling point of a liquid is the temperature at which vapour pressure of the liquid becomes equal to the atmospheric pressure, which the surface of the liquid experiences. At 1.013 bar atmospheric pressure the boiling point of the liquid is termed as normal boiling point.  
**03: Chapter 3 / Chemistry Lab Manual (EN)**  
 The boiling point of a compound is the temperature at which it changes from a liquid to a gas. This is a physical property often used to identify substances or to check the purity of the compound. It is difficult, though, to find a boiling point. Usually, chemists can only obtain a boiling range of a 2 - 3°C accuracy.
