An Introduction to Treatment of Steam Boiler Water McGraw-Hill Professional Pub

Excerpt from The Steam-Boiler Catechism: A Practical Book for Steam Engineers, and for Firemen, Owners and Makers of Boilers of Any Kind; Covering the Properties of Steam and of Fuels, and the Theory and Practice of Designing, Constructing, Setting, Connecting, Testing, Firing and Repairing The examination questions of the Canadian, New York and Philadelphia licensing boards are distributed throughout the work under their proper headings, all except those personal questions which refer to candidate's names, time of service, etc. And a few of the purely arithmetical matters. I do not claim any originality in this book. A man's knowledge in steam engineering is not invented; it is like geography, the sum of the personal knowledge of thousands of others. It is not to be supposed or expected that it will answer every question which might be asked, concerning a steam boiler. It does answer all that have occurred to me, or of which I have a record as having been asked me. As with my other Practical Catechisms, I shall take great pleasure in answering by mail, where possible, and when stamp is enclosed, questions not answered in this book; and shall add such questions and their answers, (omitting of course, correspondent's names,) to future volumes or editions should they be called for. The reader is especially requested to consult the index. About the Publisher

Not illustrated. 1900 edition. Excerpt: ... QUESTIONS FOR STATIONARY ENGINEERS. Engineers should also be prepared to answer any of the "Questions for Firemen." Q. What do you mean by the term "a one horse-power steam boiler"? A. A one horse-power boiler is one which would, under ordinary conditions, supply as much steam as would be consumed in an average steam engine producing one horse-power. Q. Is there no more definite rating than this for the horse-power of boilers? A. Yes; generally, the horse-power of boilers is based on a capacity for evaporation of 30 pounds of water per hour from feed water at a temperature of 100 Fahr. to steam at a pressure of 70 pounds. Q. What is this method of rating called? A. It is known as the Centennial Rating, because it was determined upon by the Committee of Judges at the Centennial Exhibition in 1876. Q.

Does the horse-power of steam boilers calculated according to this rule come near to the actual consumption of steam in ordinary steam engines? A. It is about right for an automatic cut-off, high-speed, non-condensing engine. For plain slide valve engines using a throttling governor the rating is much too low, while for compound and condensing engines it is too high. Q. In choosing a boiler, how would you determine upon the proper size, assuming that the horse-power is based upon the Centennial Rating? A. I would in any case have the boiler capacity somewhat in excess of that of the engine, because the evaporative power of the boiler will diminish with use owing to the accumulation of scale. Q. Is there any disadvantage in using a boiler larger than is strictly necessary to evaporate the necessary amount of steam? A. No; the efficiency of a boiler is not lessened by operating it below its maximum capacity, wherein the boiler differs...
