This model represents a bracket that will be affixed to two surfaces with four screws. Since the bracket is intended to be symmetrical, you will optimize only half of the model to reduce processing time.Using topology optimization - SiemensNX Topology Optimization is an add-on to the NX Advanced Simulation product, and so set up of the topology optimization model is very simple:

- Create a FE model of the design space, loads, and boundary conditions within NX Advanced Simulation
- Define which elements in the model that the optimization can modify
- Define a design objective, such as maximizing stiffness
- Define design constraints, such as volume, and also manufacturing constraints

to ensure that the component can be produced. NX Topology Optimization - Siemens Digital Industries Software. Topology Optimization with Siemens NX From optimized design to 3D printing. Tools of Tomorrow: Topology Optimization NX CAD | NX Design. The output of topology optimization is a JT facet body that can be converted to a convergent facet body. Once that is done, the convergent body can be used with a traditional CAD body. If we need to rebuild the facet body as a normal CAD body instead, we can use NX Reverse Engineering functions to create an exceptionally high quality model in a short time. Topology Optimization: A New Way to Create 3D Designs | NX ... You can use Simcenter to define NX Nastran topology optimization and post-process the results. This feature has its own inputs and license agreement. It works with a single overall objective (such as minimizing mass) as well as one or more constraints (such as

 I am a new

user of the Topology Optimization NX Nastran (version 12.0). I did the Siemens tutorials and tried to reproduce the same steps for another geometry that I created. However, the optimized geometry's displacement is way too high. It results in 25 mm, although I set a constraint for it to be not higher than 3 mm.
 NX NASTRAN Topology Optimization - Siemens: UG/NX - Eng-Tips
 Topology optimization is a mathematical method that optimizes material layout within a given design space, for a given set of loads, boundary conditions and constraints with the goal of maximizing the performance of the system. Due to the free forms that naturally occur, the result often needs to be adjusted before manufacturing.
