An effective systems development and design process is far easier to explain than it is to implement. A framework is needed that organizes the life cycle activities that form the process. This framework is Configuration Management (CM). Software Configuration Management discusses the framework from a standards viewpoint, using the original **A Pragmatic Guide to Business Process Modelling** SAGE  
 This reference manual is designed to help those interested in passing the ASQ's certification exam for Six Sigma Green Belts and others who want a handy reference to the appropriate materials needed to conduct successful Green Belt projects. It is a reference handbook on running projects for those who are already knowledgeable about process improvement and variation reduction. The primary layout of the handbook follows the ASQ Body of Knowledge (BoK) for the Certified Six Sigma Green Belt (CSSGB) updated in 2015. The authors were involved with the first edition

handbook, and have utilized first edition user comments, numerous Six Sigma practitioners, and their own personal knowledge gained through helping others prepare for exams to bring together a handbook that they hope will be very beneficial to anyone seeking to pass the ASQ or other Green Belt exams. In addition to the primary text, the authors have added a number of new appendixes, an expanded acronym list, new practice exam questions, and other additional materials

 Although physicians and hospitals are receiving incentives to use electronic health records (EHRs), there is little emphasis on workflow and process improvement by providers or vendors. As a result, many healthcare organizations end up with incomplete product specifications and poor adoption rates.

Creating graphical communication for public use represents both a large industry and a fertile area for thoughtful and innovative research and development. In this collection some of the world's figures within the interdisciplinary field of public graphics have been brought together to share their wisdom and present a look at this exciting world. This text is divided into a number of sections representing the rich diversity of concerns embraced by visual information designers. The first section is devoted to these foundational issues before moving on to particular domains of interest within public graphics: user instructions; warnings; forms; tables and graphs; maps and plans; way-finding information; and graphic symbols. This book is designed as a companion for anyone concerned with visual information design, particularly in the context of everyday use. Contributions are included from ergonomists, psychologists, commercial designers and health and safety professionals. The audience reflects these contributions and is pitched at a level which allows it to provide both practical guidelines and a rigorous academic understanding of the field.

This expanded second edition shows how effective and accurate modelling can deliver a more complete understanding of a business. By applying the visual modelling techniques described here, it is possible to map an entire business, using the Unified Modelling Language (UML). Jon Holt covers all aspects of the BPM process, including analysis, specification, measurement and documentation. New chapters deal with the presentation of process information, enterprise architecture and business tools.

The authors introduce an analysis and design method customized to form-based enterprise applications, the predominant type of business application. The text provides a comprehensive introduction to form-based systems, explaining their common properties and giving at the same time a hands-on introduction to the modeling of such systems. Form-based enterprise applications are modeled by a bipartite state machine and a tiered data model as a class diagram. The modeling method is explained with the TCW-3 online bookshop as a running example, in which the user can experience the modeling concepts in action.

This monograph describes mathematical models that enable prediction of phase compositions for various technological processes, as developed on the base of a complex physico-chemical analysis of reaction. It studies thermodynamics and kinetics of specific stages of complex pyrometallurgical processes involving boron, carbon, sulfur, tungsten, phosphorus, and many more, as well as their exposure to all sorts of factors. First and foremost, this enables to optimize processes and technologies at the stage of design, while traditional empirical means of development of new technologies are basically incapable of providing an optimal solution. Simulation results of metals and alloys production, welding and coating technologies allow obtaining materials with pre-given composition, structure and properties in a cost-saving and conscious manner. Moreover, a so-called "inverse problem", i.e., selecting source materials which would ensure the required results, cannot be solved by any other means.
