The Chinese invented papermaking, which by the 8th century had reached the Muslim world in Samarkand and Baghdad, and Spain by the 11th century. Much later at the end of the 18th century onwards, modern, industrial papermaking was developed by the Europeans. The History of Paper in Iran, 1501 to 1925 sets out for the reader the types of paper made in Iran during the Safavid and Qajar periods and the crucial role imported paper played in the country. The Iranian government attempted to introduce modern European paper production technology, first by sending students abroad to learn about this technology and then by purchasing equipment to set up a paper industry. However, during the 19th century, domestic Iranian paper production came under increasing pressure from paper imports, and the government abandoned its efforts to modernize the domestic paper industry. The authors, renowned scholar Willem Floor in collaboration with Amélie Couvrat Desvergnés a museum conservator of artworks on paper and books, identify and illustrate the watermarks and/or countermarks of the various paper producers and provide examples of the diversity of quality, composition, and nature of the different types of paper used by various strata of the Iranian society. Also provided are detailed import data, showing which country exported paper to Iran, via which routes, as well as their changing market position over time. Finally, the various end uses of paper, from books and farmans to paintings, and diverse packing and utilitarian paper are examined and, where possible, quantified data are presented. This book will reward scholars and general readers alike.

Building Information Modelling (BIM) is a global phenomenon which is gaining significant momentum across the world. Currently there is little information on how to realise and monitor benefits from implementing BIM across the life-cycle of a built environment asset. This book provides a practical and strategic framework to realise value from implementing BIM by adapting Benefit Realisation Management theory. It presents an approach for practitioners aiming to implement BIM across the life-cycle of built environment assets, including both buildings and infrastructure. Additionally, the book features: wide-ranging information about BIM, the challenges of monitoring progress towards benefit goals and the greater context of implementation; a set of dictionaries that illustrate: how benefits can be achieved, what the benefit flows are and the enabling tools and processes that contribute to achieving and maximising them; a suite of measures that can serve to monitor progress with examples of how they have been used to measure benefits from BIM; real-world examples from across the world and life-cycle phases that show how these benefits can be achieved; and information on international maturity and competency measures to complement the value realisation framework. Including a blend of academic and industry input, this book has been developed in close collaborative consultation with industry, government and international research organisations and could be used for industry courses on BIM benefits and implementation for asset management or by universities that teach BIM-related courses.
