The classic introduction to the fundamentals of calculus Richard Courant's classic text *Differential and Integral Calculus* is an essential text for those preparing for a career in physics or applied math. Volume 1 introduces the foundational concepts of "function" and "limit", and offers detailed explanations that illustrate the "why" as well as the "how". Comprehensive coverage of the basics of integrals and differentials includes their applications as well as clearly-defined techniques and essential theorems. Multiple appendices provide supplementary explanation and author notes, as well as solutions and hints for all in-text problems.

Research Strategies Oxford University Press - Children

Foliation theory has its origins in the global analysis of solutions of ordinary differential equations: on an n -dimensional manifold M , an [autonomous] differential equation is defined by a vector field X ; if this vector field has no singularities, then its trajectories form a partition of M into curves, i.e. a foliation of codimension $n - 1$. More generally, a foliation F of codimension q on M corresponds to a partition of M into immersed submanifolds [the leaves] of dimension $p = n - q$. The first global image that comes to mind is that of a stack of "plaques". Viewed laterally [transversally], the leaves of such a stack are the points of a quotient manifold W of dimension q . Actually, this image corresponds to an elementary type of foliation, that one says is "simple". For an arbitrary foliation, it is only locally [on a "simple" open set U] that the foliation appears as a stack of plaques and admits a local quotient manifold. Globally, a leaf L may return and cut a simple open set U in several plaques, sometimes even an infinite number of plaques.
