Safe water and adequate sanitation are basic to the health of every person on the planet yet many people throughout the world do not have access to these fundamental needs. An important step towards resolving this global crisis is to understand its magnitude: how many people lack access to drinking water and sanitation? To help answer this question household surveys and censuses are conducted every year throughout the world to assess drinking water sanitation and hygiene-related practices at the household level. Because of variations in survey tools attempts to compare the results of one survey with those of another have been fraught with difficulties. Solving survey comparability problems is crucial if we are to establish accurate trends over time within a country and compare data between

countries. For this reason the WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation developed a set of harmonized survey questions that resolves the comparability problems of the past. Including the harmonized questions in national surveys and censuses will help countries gain more systematic information on the drinking water and sanitation needs of their population. With popular use these harmonized questions will make data across international and national survey programmes more comparable which in turn will result in more accurate country regional and global estimates of unmet drinking water and sanitation needs. The core harmonized questions presented in this guide have been adopted by the Demographic and Health Surveys the Multiple Indicator Cluster Survey and the World Health Survey. The purpose of this guide is to encourage even more widespread use of these harmonized questions because accurate information is a valuable tool that can be used to assess progress towards international and national goals and targets. It also allows decision-makers and stakeholders to make evidence-based choices and direct efforts to where they are needed as well as promotes increased investment in the sector.

Making Peace with Microbes Public sanitation and antibiotic drugs have brought about historic increases in the human life span; they have also unintentionally produced new health crises by disrupting the intimate, age-old balance between humans and the microorganisms that inhabit our bodies and our environment. As a result, antibiotic resistance now ranks among the gravest medical problems of modern times. *Good Germs, Bad Germs* addresses not only this issue but also what has become known as the "hygiene hypothesis"— an argument that links the over-sanitation of modern life to now-epidemic increases in immune and other disorders. In telling the story of what went terribly wrong in our war on germs, Jessica Snyder Sachs explores our emerging understanding of the symbiotic relationship between the human body and its resident microbes—which outnumber its human cells by a factor of nine to one! The book also offers a hopeful look into a future in which antibiotics will be designed and

used more wisely, and beyond that, to a day when we may replace antibacterial drugs and cleansers with bacterial ones—each custom-designed for maximum health benefits.

Popular Science Crown Currency

Large volume food processing and preparation operations have increased the need for improved sanitary practices from processing to consumption. This trend presents a challenge to every employee in the food processing and food preparation industry. Sanitation is an applied science for the attainment of hygienic conditions. Because of increased emphasis on food safety, sanitation is receiving increased attention from those in the food industry. Traditionally, inexperienced employees with few skills who have received little or no training have been delegated sanitation duties. Yet sanitation employees require intensive training. In the past, these employees, including sanitation program managers, have had only limited access to material on this subject. Technical information has been confined primarily to a limited number of training manuals provided by regulatory agencies, industry and association manuals, and recommendations from equipment and cleaning compound firms. Most of this material lacks specific information related to the selection of appropriate cleaning methods, equipment, compounds, and sanitizers for maintaining hygienic conditions in food processing and preparation facilities. The purpose of this text is to provide sanitation information needed to ensure hygienic practices. Sanitation is a broad subject; thus, principles related to contamination, cleaning compounds, sanitizers, and cleaning equipment, and specific directions for applying these principles to attain hygienic conditions in

food processing and food preparation are discussed. The discussion starts with the importance of sanitation and also includes regulatory requirements and voluntary sanitation programs including additional and updated information on Hazard Analysis Critical Control Points (HACCP).

In the United States, some populations suffer from far greater disparities in health than others. Those disparities are caused not only by fundamental differences in health status across segments of the population, but also because of inequities in factors that impact health status, so-called determinants of health. Only part of an individual's health status depends on his or her behavior and choice; community-wide problems like poverty, unemployment, poor education, inadequate housing, poor public transportation, interpersonal violence, and decaying neighborhoods also contribute to health inequities, as well as the historic and ongoing interplay of

structures, policies, and norms that shape lives. When these factors are not optimal in a community, it does not mean they are intractable: such inequities can be mitigated by social policies that can shape health in powerful ways. *Communities in Action: Pathways to Health Equity* seeks to delineate the causes of and the solutions to health inequities in the United States. This report focuses on what communities can do to promote health equity, what actions are needed by the many and varied stakeholders that are part of communities or support them, as well as the root causes and structural barriers that need to be overcome.

Practical Ethics Yale University Press
Traces the development of the sanitary and health problems of New York City from earliest Dutch times to the culmination of a nineteenth-century reform movement that produced the Metropolitan Health Act of 1866, the forerunner of the present New York City Department of Health. Professor Duffy shows the city's transition from a clean and healthy colonial settlement to an epidemic-ridden community in the eighteenth century, as the city outgrew its health and sanitation facilities. He describes the slow growth of a demand for adequate health laws in the mid-nineteenth century, leading to the establishment of the first permanent health agency in 1866.

“One of the most profound and illuminating studies of this century to have been published in recent decades.”—John Gray, *New York Times* Book Review Hailed as “a magisterial critique of top-down social planning” by the *New York Times*, this essential work analyzes disasters from Russia to Tanzania to uncover why states so often fail—sometimes catastrophically—in grand efforts to engineer their society or their environment, and uncovers the conditions common to all such planning disasters. “Beautifully written, this book calls into sharp relief the nature of the world we now inhabit.”—*New Yorker* “A tour de force.”—Charles Tilly, Columbia University

The Wednesday Wars Cengage Learning Examines the culture, politics, and history of the movement for environmental justice in New York City, tracking activism in four neighborhoods

on issues of public health, garbage, and energy systems in the context of privatization, deregulation, and globalization. Racial minority and low-income communities often suffer disproportionate effects of urban environmental problems. Environmental justice advocates argue that these communities are on the front lines of environmental and health risks. In *Noxious New York*, Julie Sze analyzes the culture, politics, and history of environmental justice activism in New York City within the larger context of privatization, deregulation, and globalization. She tracks urban planning and environmental health activism in four gritty New York neighborhoods: Brooklyn's Sunset Park and Williamsburg sections, West Harlem, and the South Bronx. In these communities, activism flourished in the 1980s and 1990s in response to economic decay and a concentration of noxious incinerators, solid waste transfer stations, and power plants. Sze describes the emergence of local campaigns organized around issues of asthma, garbage, and energy systems, and how, in each neighborhood, activists framed their arguments in the vocabulary of environmental justice. Sze shows that the linkage of planning and public health in New York City goes back to the nineteenth century's sanitation movement, and she looks at the city's history of garbage, sewage, and sludge management. She analyzes the influence of race, family, and gender politics on asthma activism and examines community activists' responses to garbage privatization and energy deregulation. Finally, she looks at how activist groups have begun to shift from fighting particular siting and land use decisions to engaging in a larger

process of community planning and community-based research projects. Drawing extensively on fieldwork and interviews with community members and activists, Sze illuminates the complex mix of local and global issues that fuels environmental justice activism.

For thirty years, Peter Singer's Practical Ethics has been the classic introduction to applied ethics. For this third edition, the author has revised and updated all the chapters and added a new chapter addressing climate change, one of the

most important ethical challenges of our generation. Some of the questions discussed in this book concern our daily lives. Is it ethical to buy luxuries when others do not have enough to eat? Should we buy meat from intensively reared animals? Am I doing something wrong if my carbon footprint is above the global average? Other questions confront us as concerned citizens:

equality and discrimination on the grounds of race or sex; abortion, the use of embryos for research and euthanasia; political violence and terrorism; and the preservation of our planet's environment. This book's lucid style and provocative arguments make it an ideal text for university courses and for anyone willing to think about how she or he ought to live.
