Production and utilization of sustainable energy toward maintaining a clean environment is a major challenge. At the same time, the continued depletion of fossil fuels and the global dependency on non-renewable fuels is a chief concern.

Moreover, the long-term economic and environmental issues associated with the high utilization of fossil fuel, such as global warming, are also important, particularly in the context of the predicted increase in the global population to around 5 billion by 2050. In recent years, researchers have been investigating alternative, renewable fuels to replace fossil fuels. Of the various options, biofuels are especially attractive due to their low production costs and the fact that they are pollution free. Also known as transportation fuels, their energy is derived from biological

resources or through the biological processes. Biofuels such as biohydrogen, biomethane, biogas, ethanol and butanol offer a number of advantages and can be economically produced from cellulosic biomass. As such, they can play a vital role in sustainably meeting future energy demands. Biofuels have the potential to become a global primary energy source, offering significant reductions in greenhouse gas emissions as well as opportunities to increase economic and social development in rural communities and reduce the problems associated with

waste disposal. However, low yields and lack of process technology are some of the aspects that need to be addressed. This book offers an overview of existing biofuels and the technologies to solve the problems associated with their practical implementation. Evaluating the biofuel options and discussing the opportunities and risks in relation to resources, technologies, practices, markets and policy, it provides insights into the development of economically viable bioenergy industries.

"Having been born a freeman, and for more than thirty years enjoyed the blessings of liberty in a free State—and having at the end of that time been kidnapped and sold into Slavery, where I remained, until happily rescued in the month of January, 1853, after a bondage of twelve years—it has been suggested that an account of my life and fortunes would not be uninteresting to the public." - an excerpt

This volume – for pharmacologists, systems biologists, philosophers and historians of medicine – points to investigate new avenues in pharmacology research, by providing a full assessment of the premises underlying a radical shift in the pharmacology paradigm. The pharmaceutical industry is currently facing unparalleled challenges in developing innovative drugs. While drug-developing scientists in the 1990s mostly welcomed the transformation into a target-based approach, two decades of experience shows that this model is failing to boost both drug discovery and efficiency. Selected targets were often not druggable and with poor disease linkage, leading to either high toxicity or poor efficacy. Therefore, a profound rethinking of the current paradigm is needed. Advances in systems biology are revealing a phenotypic robustness and a network structure that strongly suggest that

exquisitely selective compounds, compared with multitarget drugs, may exhibit lower than desired clinical efficacy. This appreciation of the role of polypharmacology has significant implications for tackling the two major sources of attrition in drug development, efficacy and toxicity. Integrating network biology and polypharmacology holds the promise of expanding the current opportunity space for druggable targets. *The Venetian Patriciate ; Reality Versus Myth* John Wiley & Sons

Concrete Pressure Pipe, 3rd Ed. Manohar Publishers

Waste Siege offers an analysis unusual in the study of Palestine: it depicts the environmental, infrastructural, and aesthetic context in which Palestinians are obliged to forge their lives. To speak of waste siege is to describe a series of conditions, from smelling wastes to negotiating military infrastructures, from

biopolitical forms of colonial rule to experiences of governmental abandonment, from obvious targets of resistance to confusion over responsibility for the burdensome objects of daily life. Within this rubble, debris, and infrastructural fallout, West Bank Palestinians create a life under settler colonial rule. Sophia Stamatopoulou-Robbins focuses on waste as an experience of everyday life that is continuous with, but not a result only of, occupation. Tracing Palestinians' own experiences of wastes over the past decade, she considers how multiple authorities governing the West Bank—including municipalities, the Palestinian Authority, international aid organizations, NGOs, and Israel—rule by waste siege, whether intentionally or not. Her work challenges both common formulations of waste as "matter out of place" and as the ontological opposite of the environment, by suggesting instead that waste siege be understood as an ecology of "matter with no place to go." Waste siege thus not only describes a stateless Palestine, but also becomes a metaphor for our besieged planet.
