Stress has a broad impact on animals' behavior, profoundly affects brain regions involved on cognition and motivation and, when maladaptive, is also a trigger for neuropsychiatric disorders. This book focuses on advances in understanding how stressful events impact cognition and motivation, and the neural mechanisms that mediate their effects. Additionally, this book seeks to highlight the most recent efforts to identify individual factors that can alter an organism's response to stressful stimuli, and to describe pharmacological and non-pharmacological interventions that can mitigate the deleterious effects of stress on cognition and motivation.

In many Sub-Saharan countries, farmers cannot meet the growing urban demand for higher quality products, leading to increasing dependency on imports. While the literature has focused on production-side constraints to enhancing smallholder farmers' output quality, there is scarce evidence of market-side constraints. Using a unique sample of 60 wheat markets in Ethiopia, I examine the relationship between the price obtained by farmers and the quality supplied. Using objective and precise measures of observable (impurity content) and unobservable (flour extraction rate and moisture level) quality attributes, no evidence was found of a strong correlation between the two, suggesting that observable attributes cannot serve as proxies for unobservable ones. Transaction prices further reflect this, indicating that, markets only reward quality attributes that are observable at no cost. However, these results hide cross-market heterogeneity. Observable quality attributes are better rewarded in larger and more competitive markets, while unobservable attributes are rewarded in the presence of grain millers and/or farmer cooperatives on the market site. Both regression and machine learning approaches support these findings.

This ground-breaking book advances the fundamental debate about the nature of addiction. As well as presenting the case for seeing addiction as a brain disease, it brings together all the most cogent and penetrating critiques of the brain disease model

of addiction (BDMA) and the main grounds for being skeptical of BDMA claims. The idea that addiction is a brain disease dominates thinking and practice worldwide. However, the editors of this book argue that our understanding of addiction is undergoing a revolutionary change, from being considered a brain disease to a disorder of voluntary behavior. The resolution of this controversy will determine the future of scientific progress in understanding addiction, together with necessary advances in treatment, prevention, and societal responses to addictive disorders. This volume brings together the various strands of the contemporary debate about whether or not addiction is best regarded as a brain disease. Contributors offer arguments for and against, and reasons for uncertainty; they also propose novel alternatives to both brain disease and moral models of addiction. In addition to reprints of classic articles from the addiction research literature, each section contains original chapters written by authorities on their chosen topic. The editors have assembled a stellar cast of chapter authors from a wide range of disciplines - neuroscience, philosophy, psychiatry, psychology, cognitive science, sociology, and law - including some of the most brilliant and influential voices in the field of addiction studies today. The result is a landmark volume in the study of addiction which will be essential reading for advanced students and researchers in addiction as well as professionals such as medical practitioners, psychiatrists, psychologists of all varieties, and social workers.

Self-Control in Animals and People takes an interdisciplinary look at what self-control is, how it works, and whether humans are alone as a species in their ability to demonstrate self-control. The book outlines historical and recent empirical approaches to understanding when self-control succeeds and fails, and which species may share with humans the ability to anticipate better future outcomes. It also provides readers with in-depth explorations of whether various species can delay gratification, the ways in which people and animals exhibit other forms of self-control, what influences the capacity and expression of self-control, and much more. In addition to its comprehensive coverage of self-control research, the book also describes self-control assessment tests that can be used with young children, adults, and a wide variety of nonhuman species, with the goal of

making fair and clear comparisons among the groups. This combination makes *Self-Control in Animals and People* a valuable resource for cognitive, developmental, and clinical psychologists, philosophers, academic students and researchers in psychology and the social sciences, and animal behaviorists. Provides a comprehensive perspective of the evolutionary emergence of self-control across species Explores different "kinds" of self-control and their links to one another, and whether self-control can be improved or strengthened Offers insight on mental time travel (chronesthesia) and how it relates to self-control Demonstrates how to develop self-control tests for human and nonhuman animals, and how to make fair and clear comparisons among those groups
