Operations Management McGraw-Hill Education

This fast-paced business novel does for project management what *The Goal* and *It's Not Luck* have done for production and marketing. Goldratt's novels have traditionally slain sacred cows and delivered new ways of looking at processes which seem like common sense once you read them. *Critical Chain* is no exception. In perhaps Eli's most readable book yet, two of the established principles of project management, the engineering estimate and project milestones, are found wanting and dismissed, and other established principles are up for scrutiny - as Goldratt once more applies his Theory of Constraints. The approach is radical, yet clear, understandable and logical. New techniques are introduced, and Project Buffers, Feeding Buffers, Limit Multitasking, Improved Communications and Correct Measurements make them work. Goldratt even handles the complicated statistics of dispersed variability versus accumulated variability so deftly you won't even be aware of learning about them - they'll just seem like more common sense! *Critical Chain* is critical reading for anyone who deals with projects. If you use block diagrams, drawings or charts to keep track of your activities, you are managing a project - and this book is for you.

This book explores influential designers' sketchbooks as a truer reflection of a designer's thought processes, preoccupations, and problem-solving strategies than can be had by simply viewing finished projects. Highly personal and idiosyncratic, sketchbooks offer an arena for unstructured exploration, a space free from all budgetary and client constraints. Visually arresting objects in their own right, this book aims to elevate sketches from mere ephemera to important documents where the reader can glean valuable insight into the creative process, and apply it to their own practices. Featured designers include Ralph Caplan, Nigel Holmes, Chris Bigg, Eva Jiricna, Jason Munn, Gary Baseman, Marian Bantjes, and many others.

The colour of carbon matters. Green carbon is the carbon stored in the plants and soil of natural ecosystems and is a vital part of the global carbon cycle. This report is the first in a series that examines the role of natural forests in the storage of carbon, the impacts of human land use activities, and the implications for climate change policy nationally and internationally. REDD ("reducing emissions from deforestation and degradation") is now part of the agenda for the "Bali Action Plan" being debated in the lead-up to the Copenhagen climate change conference in 2009. Currently, international rules are blind to the colour of carbon so that the green carbon in natural forests is not recognized, resulting in perverse outcomes including ongoing deforestation and forest degradation, and the conversion of extensive areas of land to industrial plantations. This report examines REDD policy from a green carbon scientific perspective. Subsequent reports will focus on issues concerning the carbon sequestration potential of commercially logged natural forests, methods for monitoring REDD, and the long term implications of forest policy and management for the global carbon cycle and climate change.

Consistently touted as one of Stevenson and Hojati's greatest strengths, *Operations Management* has been written both clearly and concisely. Stevenson is designed to promote student understanding of the role of operations management in successful business, which, in turn, promotes student success in class. This text strives to achieve a careful balance in the presentation of operations management and to balance classical topics with new developments that particularly interest students. These real-life examples balance off against both the theoretical material and hands-on experiential cases used to present the core material in the text. At the same time, the text is widely regarded for its clarity and conciseness, offering students an easy-to-navigate and understand connection between the theoretical and the practical sides of the coin. Howard Aiken Routledge

Biography of Howard Aiken, a major figure of the early digital era, by a major historian of science who was also a colleague of Aiken's at Harvard. Howard Hathaway Aiken (1900-1973) was a major figure of the early digital era. He is best known for his first machine, the IBM Automatic Sequence Controlled Calculator or Harvard Mark I, conceived in 1937 and put into operation in 1944. But he also made significant contributions to the development of applications for the new machines and to the creation of a university curriculum for computer science. This biography of Aiken, by a major historian of science who was also a colleague of Aiken's at Harvard, offers a clear and often entertaining introduction to Aiken and his times. Aiken's Mark I was the most intensely used of the early large-scale, general-purpose automatic digital computers, and it had a significant impact on the machines that followed. Aiken also proselytized for the computer among scientists, scholars, and businesspeople and explored novel applications in data processing, automatic billing, and production control. But his most lasting contribution may have been the students who received degrees under him and then took prominent positions in academia and industry. I. Bernard Cohen argues convincingly for Aiken's significance as a shaper of the computer world in which we now live.
