we consider the problem of constructing the roots of a polynomial. Suppose that F is a subfield of the complex numbers, and $f(x)$ is a polynomial over F . Galois theory is about fields which we denote by K . A field is a ring where $1 \neq 0$, and where for all $x \neq 0$, there exists y with $xy = 1$. Example. 1. \mathbb{Q} = rational numbers. 2. the fraction field in n variables: $k(t_1, \dots, t_n) = \text{Frac}(k[t_1, \dots, t_n])$. 3. \mathbb{R} , \mathbb{C} . 4. finite field $F = \mathbb{Z}/(p)$ for a prime number p . 5.
