Illness as Metaphor Lippincott Williams & Wilkins

When it comes to disease, who beats the odds — and why? When it comes to spontaneous healing, skepticism abounds. Doctors are taught that “miraculous” recoveries are flukes, and as a result they don’t study those cases or take them into account when treating patients. Enter Dr. Jeff Rediger, who has spent over 15 years studying spontaneous healing, pioneering the use of scientific tools to investigate recoveries from incurable illnesses. Dr. Rediger’s research has taken him from America’s top hospitals to healing centers around the world—and along the way he’s uncovered insights into why some people beat the odds. In *Cured*, Dr. Rediger digs down to the root causes of illness, showing how to create an environment that sets the stage for healing. He reveals the patterns behind healing and lays out the physical and mental principles associated with recovery: first, we need to physically heal our diet and our immune systems. Next, we need to mentally heal our stress response and our identities. Through rigorous research, Dr. Rediger shows that much of our physical reality is created in our minds. Our perception changes our experience, even to the point of changing our physical bodies—and thus the healing of our identity may be our greatest tool to recovery. Ultimately, miracles only contradict what we know of nature at this point in time. *Cured* leads the way in explaining the science behind these miracles, and provides a first-of-its-kind guidebook to both healing and preventing disease.

For two hundred years a noble Venetian family has suffered from an inherited disease that strikes their members in middle age, stealing their sleep, eating holes in their brains, and ending their lives in a matter of months. In Papua New Guinea, a primitive tribe is nearly obliterated by a sickness whose chief symptom is uncontrollable laughter. Across Europe, millions of sheep rub their fleeces raw before collapsing. In England, cows attack their owners in the milking parlors, while in the American West, thousands of deer starve to death in fields full of grass. What these strange

conditions—including fatal familial insomnia, kuru, scrapie, and mad cow disease—share is their cause: prions. Prions are ordinary proteins that sometimes go wrong, resulting in neurological illnesses that are always fatal. Even more mysterious and frightening, prions are almost impossible to destroy because they are not alive and have no DNA—and the diseases they bring are now spreading around the world. In *The Family That Couldn't Sleep*, essayist and journalist D. T. Max tells the spellbinding story of the prion’s hidden past and deadly future. Through exclusive interviews and original archival research, Max explains this story’s connection to human greed and ambition—from the Prussian chemist Justus von Liebig, who made cattle meatier by feeding them the flesh of other cows, to New Guinean natives whose custom of eating the brains of the dead nearly wiped them out. The biologists who have investigated these afflictions are just as extraordinary—for example, Daniel Carleton Gajdusek, a self-described “pedagogic pedophile pediatrician” who cracked kuru and won the Nobel Prize, and another Nobel winner, Stanley Prusiner, a driven, feared self-promoter who identified the key protein that revolutionized prion study. With remarkable precision, grace, and sympathy, Max—who himself suffers from an inherited neurological illness—explores maladies that have tormented humanity for centuries and gives reason to hope that someday cures will be found. And he eloquently demonstrates that in our relationship to nature and these ailments, we have been our own worst enemy.

A much-needed program to prevent and reverse disease, and discover a path to sustainable, long-term health from an acclaimed international doctor and star of the BBC program *Doctor in the House*. *How to Make Disease Disappear* is Dr. Rangan Chatterjee’s revolutionary, yet simple guide to better health—a much-needed, accessible plan that will help you take back control of your health and your life. A physician dedicated to finding the root cause of ill health rather than simply suppressing symptoms with drugs, Dr. Chatterjee passionately advocates and follows a philosophy that lifestyle and nutrition are first-line medicine and the cornerstone of good health. Drawing on cutting edge research and his own experiences as a doctor, he argues that the secret to preventing disease and achieving wellness revolves around four critical pillars: food, relaxation, sleep, and movement. By making small, incremental changes in each of these key areas, you can create and maintain good health—and alleviate and prevent illness. As Dr. Chatterjee reveals we can reverse and make disease disappear without a complete overhaul of our lifestyle. His dynamic, user-friendly approach is not about excelling at any one pillar. What matters is balance in every area of your life, which includes: Me-time every day An electronic-free Sabbath once a week Retraining your taste buds Daily micro-fasts Movement snacking A bedtime routine Practical and life-changing, *How to Make Disease Disappear* is an inspiring and easy-to-follow guide to better health and happiness.

Persistent Viral Infections Edited by Rafi Ahmed Emory Vaccine Center, Atlanta, USA and Irvin S. Y. Chen UCLA School of Medicine, Los Angeles, USA During the past decade much of our attention has focused on diseases associated with viral persistence. Major breakthroughs in immunology, and the advent of molecular approaches to study pathogenesis have increased our understanding of the complex virus-host interactions that occur during viral persistence. Persistent Viral Infections focuses on: * The pathogenesis and immunology of chronic infections * Animal models that provide, or have the potential to provide, major insights This volume will be essential reading for virologists, immunologists, oncologists and neurologists.

"The inspiring memoir of a young doctor and former college athlete who became a champion for people suffering from rare, under-researched diseases--all while battling his own. A former Georgetown quarterback nicknamed "The Beast," David Fajgenbaum was also a force in medical school, where he was known for his unmatched mental stamina. But things changed dramatically when he began suffering from inexplicable fatigue. In a matter of weeks, his organs were failing and he was read his last rites. Doctors were baffled over a condition they had yet to even diagnose; floating in and out of consciousness, Fajgenbaum prayed for the equivalent of game day overtime: a second chance. Miraculously, Fajgenbaum survived, but only to endure repeated near-death relapses from what would eventually be identified as a form of Castleman disease--an extremely deadly and rare condition that acts like a cross between cancer and an autoimmune disease. When he relapsed on the only drug in development and realized that the medical community was unlikely to make progress in time to save his life, Fajgenbaum turned his desperate hope for a cure into concrete action: between hospitalizations he studied his own charts and tested his own blood samples, looking for clues that could unlock a new treatment. With the help of family, friends and mentors, he also reached out to other Castleman disease patients and physicians, and eventually came up with an ambitious plan to crowdsource the most promising research questions and recruit world-class researchers to tackle them; instead of waiting for the scientific stars to align, he proposed to align them himself. More than five years later and now married to his college sweetheart, his hard work has paid off: a treatment that he identified has induced a tentative remission and his novel approach to collaborative scientific inquiry has become a blueprint for

advancing rare disease research. His incredible story demonstrates the potency of hope, and what can happen when forces of determination, love, family, faith and serendipity collide"--

Studying the requirements for healthy living will always bring to mind the words of the Canadian Clergyman, A.J. Materi, "So many people spend their health gaining wealth, and then have to spend their wealth to regain their health". It is fast becoming a truth that the price of success can be very demanding as we journey on in life, especially for those born without the proverbial "silver spoon". Sometimes, the price paid takes a toll on our health, a price some people pay with their own lives. This work is to help individuals working the hours and going the extra hours yet want to stay healthy. It will deliver into your hands easy and quick suggestions on how to combine a busy schedule and maintain a health balance. The dietary advices are practicable and will help anyone go through the day feeding on the important nutrient factors as required by the body, for health and proper aging. Above all, Dr. John Christopher said in his book, "Curing the Incurables", that there are no incurable diseases but there are only incurable people. This book might be the solution to the issues tagged incurable in your health.

In the 21st century, people in the developed world are living longer. They hope they will have a healthy longer life and then die relatively quickly and peacefully. But frequently that does not happen. While people are living healthy a little longer, they tend to live sick for a lot longer. And at the end of being sick before dying, they and their families are frequently faced with daunting decisions about whether to continue life prolonging medical treatments or whether to find meaningful and forthright ways to die more easily and quickly. In this context, some people are searching for more and better options to hasten death. They may be experiencing unacceptable suffering in the present or may fear it in the near future. But they do not know the full range of options legally available to them. Voluntary stopping eating and drinking (VSED), though relatively unknown and poorly understood, is a widely available option for hastening death. VSED is legally permitted in places where medical assistance in dying (MAID) is not. And unlike U.S. jurisdictions where MAID is legally permitted, VSED is not limited to terminal illness or to those with current decision-making capacity. VSED is a compassionate option that respects patient choice. Despite its strongly misleading image of starvation, death by VSED is typically peaceful and meaningful when accompanied by adequate clinician and/or caregiver support. Moreover, the practice is not limited to avoiding unbearable suffering, but may also be used by those who are determined to avoid living with unacceptable deterioration such as severe dementia. But VSED is "not for everyone." This volume provides a realistic, appropriately critical, yet supportive assessment of the practice. Eight illustrative, previously unpublished real cases are included, receiving pragmatic analysis in each chapter. The volume's integrated, multi-professional, multi-disciplinary character makes it useful for a wide range of readers: patients considering present or future end-of-life options and their families,

clinicians of all kinds, ethicists, lawyers, and institutional administrators. Appendices include recommended elements of an advance directive for stopping eating and drinking in one's future if and when decision making capacity is lost, and what to record as cause of death on the death certificates of those who hasten death by VSED.

The Quest for the Cure Columbia University Press

"Should be read by anyone with a body. . . . Relentlessly researched and undeniably smart." —The New York Times Named one of BuzzFeed's "Best Books of 2021" What Doesn't Kill You is the riveting account of a young journalist's awakening to chronic illness, weaving together personal story and reporting to shed light on living with an ailment forever. Tessa Miller was an ambitious twentysomething writer in New York City when, on a random fall day, her stomach began to seize up. At first, she toughed it out through searing pain, taking sick days from work, unable to leave the bathroom or her bed. But when it became undeniable that something was seriously wrong, Miller gave in to family pressure and went to the hospital—beginning a years-long nightmare of procedures, misdiagnoses, and life-threatening infections. Once she was finally correctly diagnosed with Crohn's disease, Miller faced another battle: accepting that she will never get better. Today, an astonishing three in five adults in the United States suffer from a chronic disease—a percentage expected to rise post-Covid. Whether the illness is arthritis, asthma, Crohn's, diabetes, endometriosis, multiple sclerosis, ulcerative colitis, or any other incurable illness, and whether the sufferer is a colleague, a loved one, or you, these diseases have an impact on just about every one of us. Yet there remains an air of shame and isolation about the topic of chronic sickness. Millions must endure these disorders not only physically but also emotionally, balancing the stress of relationships and work amid the ever-present threat of health complications. Miller segues seamlessly from her dramatic personal experiences into a frank look at the cultural realities (medical, occupational, social) inherent in receiving a lifetime diagnosis. She offers hard-earned wisdom, solidarity, and an ultimately surprising promise of joy for those trying to make sense of it all.

A revolutionary, proven program for reversing the symptoms of Alzheimer's disease and cognitive decline from award winning neurologists and codirectors of the Brain Health and Alzheimer's Prevention Program at Loma Linda University Medical Center Over 47 million people are currently living with Alzheimer's disease worldwide. While all other major diseases are in decline, deaths from Alzheimer's have increased radically. What you or your loved ones don't yet know is that 90 percent of Alzheimer's cases can be prevented. Based on the largest clinical and observational study to date, neurologists and codirectors of the Brain Health and Alzheimer's Prevention Program at Loma Linda University Medical Center, Drs. Dean and Ayesha Sherzai, offer in The Alzheimer's Solution the first comprehensive program for preventing Alzheimer's disease and improving cognitive function. Alzheimer's disease isn't a genetic inevitability, and a diagnosis does not need to come with a death sentence. Ninety percent of grandparents, parents, husbands, and wives can be spared. Ninety percent of us can avoid ever getting Alzheimer's, and for the 10 percent with strong genetic risk for cognitive decline, the disease can be delayed by ten to fifteen years. This isn't an estimate or wishful thinking; it's a percentage based on rigorous science and the remarkable results the Sherzais have seen firsthand in their clinic. This much-needed revolutionary book reveals how the brain is a living universe, directly influenced by nutrition, exercise, stress, sleep, and engagement. In other words: what you feed it, how you treat it, when you challenge it, and the ways in which you allow it to rest. These factors are the pillars of the groundbreaking program you'll find in these pages, which features a personalized assessment for evaluating risk, a five-part program for prevention and symptom-reversal, and day-by-day guides for optimizing cognitive function. You can prevent Alzheimer's disease from affecting you, your family, friends, and loved ones. Even with a diagnosis, you can reverse cognitive decline and add vibrant years to your life. The future of your brain is finally within your control.

The Science Beyond the Controversy HarperCollins

How do you live well when the physical foundation of your life is crumbling? This is the challenge for millions who live with diseases for which there is no cure. In When There Is No Cure, Dr. Craig Svensson guides readers to a path of thriving when life's journey includes an incurable ailment.

Chronic Disease in the Twentieth Century Penguin

The instant New York Times and Wall Street Journal bestseller A groundbreaking plan to prevent and reverse Alzheimer's Disease that fundamentally changes how we understand cognitive decline. Everyone knows someone who has survived cancer, but until now no one knows anyone who has survived Alzheimer's Disease. In this paradigm shifting book, Dale Bredesen, MD, offers real hope to anyone looking to prevent and even reverse Alzheimer's Disease and cognitive decline. Revealing that AD is not one condition, as it is currently treated, but three, The End of Alzheimer's outlines 36 metabolic factors (micronutrients, hormone levels, sleep) that can trigger "downsizing" in the brain. The protocol shows us how to rebalance these factors using lifestyle modifications like taking B12, eliminating gluten, or improving oral hygiene. The results are impressive. Of the first ten patients on the protocol, nine displayed significant improvement with 3-6 months; since then the protocol has yielded similar results with hundreds more. Now, The End of Alzheimer's brings new hope to a broad audience of patients, caregivers, physicians, and treatment centers with a fascinating look inside the

science and a complete step-by-step plan that fundamentally changes how we treat and even think about AD.

A Life with Chronic Illness - Lessons from a Body in Revolt JHU Press

Mind Fixers tells the history of psychiatry's quest to understand the biological basis of mental illness and asks where we need to go from here. In Mind Fixers, Anne Harrington, author of *The Cure Within*, explores psychiatry's repeatedly frustrated struggle to understand mental disorder in biomedical terms. She shows how the stalling of early twentieth century efforts in this direction allowed Freudians and social scientists to insist, with some justification, that they had better ways of analyzing and fixing minds. But when the Freudians overreached, they drove psychiatry into a state of crisis that a new "biological revolution" was meant to alleviate. Harrington shows how little that biological revolution had to do with breakthroughs in science, and why the field has fallen into a state of crisis in our own time. Mind Fixers makes clear that psychiatry's waxing and waning biological enthusiasms have been shaped not just by developments in the clinic and lab, but also by a surprising range of social factors, including immigration, warfare, grassroots activism, and assumptions about race and gender. Government programs designed to empty the state mental hospitals, acrid rivalries between different factions in the field, industry profit mongering, consumerism, and an uncritical media have all contributed to the story as well. In focusing particularly on the search for the biological roots of schizophrenia, depression, and bipolar disorder, Harrington underscores the high human stakes for the millions of people who have sought medical answers for their mental suffering. This is not just a story about doctors and scientists, but about countless ordinary people and their loved ones. A clear-eyed, evenhanded, and yet passionate tour de force, Mind Fixers recounts the past and present struggle to make mental illness a biological problem in order to lay the groundwork for creating a better future, both for those who suffer and for

those whose job it is to care for them.

A Breakthrough Program to Prevent and Reverse the Symptoms of Cognitive Decline at Every Age HarperCollins

A trailblazing, conversation-starting history of women's health—from the earliest medical ideas about women's illnesses to hormones and autoimmune diseases—brought together in a fascinating sweeping narrative. Elinor Cleghorn became an unwell woman ten years ago. She was diagnosed with an autoimmune disease after a long period of being told her symptoms were anything from psychosomatic to a possible pregnancy. As Elinor learned to live with her unpredictable disease she turned to history for answers, and found an enraging legacy of suffering, mystification, and misdiagnosis. In *Unwell Women*, Elinor Cleghorn traces the almost unbelievable history of how medicine has failed women by treating their bodies as alien and other, often to perilous effect. The result is an authoritative and groundbreaking exploration of the relationship between women and medical practice, from the "wandering womb" of Ancient Greece to the rise of witch trials across Europe, and from the dawn of hysteria as a catchall for difficult-to-diagnose disorders to the first forays into autoimmunity and the shifting understanding of hormones, menstruation, menopause, and conditions like endometriosis. Packed with character studies and case histories of women who have suffered, challenged, and rewritten medical orthodoxy—and the men who controlled their fate—this is a revolutionary examination of the relationship between women, illness, and medicine. With these case histories, Elinor pays homage to the women who suffered so strides could be made, and shows how being unwell has become normalized in society and culture, where women have long been distrusted as reliable narrators of their own bodies and pain. But the time for real change is long overdue: answers reside in the body, in the testimonies of unwell women—and their lives depend on medicine learning to listen.
