Division of Structural Engineering Content • Design philosophy – Structural purpose – Force paths at different levels – Mechanical behaviour – design aspects • Basic force transfer mechanisms – Compression – Shear – Tension – Bending – torsion • fib Bulletin on – Structural connections Design of Structural Connections Connections are an essential part of any structure, and in timber structures they are often the most critical part of a design. The timber section size is

often determined by the strength of the section remaining after drilling holes for bolts or dowels, or by the spacing requirements for the fasteners, rather than the load-carrying capacity of the timber. Design of structural timber connections - TRADA There is a discrepancy between the actual behavior and the analysis of steel structure is large, therefore the connections are complex to analyze and design. When the structural member fails in case of overloading then there is a general practice to prefer the individual member rather than the connections, therefore this kind of practice affects many structural members.
