Differential Protection Scheme works by using two separate quantities calculated from the primary current (I_{W1C}) and secondary current (I_{W2C}). SEL787 and SEL 387/587 Transformer differential relay is used for this discussion. Other similar relays use similar concepts through the actual terminology could be different. Transformer Differential Protection - Voltage Disturbance • Current & Voltage Transformer: also called instrument transformers. Their purpose is to step down the current or voltage of a device to measurable values, within the instrumentation measurement range 5A or 1A in the case of a current transformers (CTs), and 110V or 100V in the case of a voltage (or potential) trans-formers (VTs/ PTs). Power System Protective Relaying: basic concepts ...As dry transformer is a static device with no moving parts, it has a trouble free life under normal operating conditions. There are multiple insulation classes such as Class A (105°C), Class B (130°C), Class F (155°C), Class H (180°C) and Class R (220°C) and the proper one should be selected according to the needs and design for reliable transformer operation and life.
