A Record of Aerospace Achievement Springer
Introduce your students to image processing with the industry's most prized text For 40 years, Image Processing has been the foundational text for the study of digital image processing. The book is suited for students at the college senior and first-year graduate level with prior background in mathematical analysis, vectors, matrices, probability, statistics, linear systems, and computer programming. As in all earlier editions, the focus of this edition of the book is on fundamentals. The 4th Edition, which celebrates the book's 40th anniversary, is based on an extensive survey of faculty, students, and independent readers in 150 institutions from 30 countries. Their feedback led to expanded or new coverage of topics such as deep learning and deep neural networks, including convolutional neural nets, the scale-invariant feature transform (SIFT), maximally-stable extremal regions (MSERs), graph cuts, k-means clustering and superpixels, active contours (snakes and level sets), and exact histogram matching. Major improvements were made in reorganizing the material on image transforms into a more cohesive presentation, and in the discussion of spatial kernels and spatial filtering. Major revisions and additions were made to examples and homework exercises throughout the book. For the first time, we added MATLAB projects at the end of every chapter, and compiled support packages for you and your teacher containing, solutions, image databases, and sample code. Whether for computer evaluation of otherworldly terrain or the latest high definition 3D blockbuster, digital image processing involves the acquisition, analysis, and processing of visual information by computer and requires a unique skill set that has yet to be defined a single text. Until now. Taking an applications-oriented, engineering approach, Digital Image Processing and Analysis provides the tools for developing and advancing computer and human vision applications and brings image processing and analysis together into a unified framework. Providing information and background in a logical, as-needed fashion, the author presents topics as they become necessary for understanding the practical imaging model under study. He offers a conceptual presentation of the material for a solid understanding of complex topics and discusses the theory and foundations of digital image processing and the algorithm development needed to advance the field. With liberal use of color through-out and more materials on the processing of color images than the previous edition, this book provides supplementary exercises, a new chapter on applications, and two major new tools that allow for batch processing, the analysis of imaging algorithms, and the overall research and development of imaging applications. It includes two new software tools, the Computer Vision and Image Processing Algorithm Test and Analysis Tool (CVIP-ATAT) and the CVIP Feature Extraction and Pattern Classification Tool (CVIP-FEPC). Divided into five major sections, this book provides the concepts and models required to analyze digital images and develop computer vision and human consumption applications as well as all the necessary information to use the CVIPtools environment for algorithm development, making it an ideal reference tool for this fast growing field.

Richard Owen was, after Darwin, the most important figure in Victorian natural history. He was, for most of the six decades of his career, Britain's foremost comparative anatomist and vertebrate palaeontologist. As the most renowned opponent of natural selection, Owen was type-cast as a Cuvierian creationist and became the bete noire of the Darwinian evolution debate. In this comprehensive intellectual and scientific biography, Nicolaas Rupke argues that Owen was no simple-minded anti-evolutionist and, moreover, should be freed from the distortion of the evolution dispute that was only a minor part of his work, yet has come to dominate his memory.
Practical Machine Learning and Image Processing Springer
This volume provides a perceptive background to modern Japanese culture. Ishida attempts a balanced evaluation of modern Japan, seeking to explain why the basic characteristics of Japanese society permit two almost opposite assessments. He divides the development of modern Japan into two stages: first, the period starting from the Meiji Restoration (1868) up to the end of World War II; second, from the defeat of Japan in World War II up to the present. Ishida investigates the essential features of the modern Japanese value system and the social structure, which comprise both traditional and modern elements. He examines how Japanese society has adapted Western influences to suit its own needs--the real "miracle" of modern Japan. As the Japanese economy grows and Japan becomes an economic superpower, political self-confidence is also emerging. Ishida, however, remains critical of Japanese society, because he feels that Japan lacked the internal resources to change the political system from within until its defeat by the Allies forced it to introduce various reforms ordered by the occupation authorities. Despite the rapid changes taking place in Japanese society, certain attitudes, such as conformity and competition, are common to both the prewar and postwar periods. The final section is devoted to the field of peace research. Ishida presents differences of meaning in the concepts of peace in ancient Hebrew, Greek, Roman, Chinese, and Indian cultures in order to characterize the Japanese concept of peace, which, akin

to the Chinese, emphasizes harmony rather than justice. He goes on to discuss Japan's images of Gandhi, which, according to the author, were projections of ultranationalist prejudice and missed the significance of his nonviolent direct action. Ishida emphasizes the importance of such nonviolent action as a means to carry out social change toward the realization of justice.

Set in Sydney in the 1970s and 1980s, 'Blue Murder' is the story of the friendship between drug dealer and robber Arthur Stanley 'Neddy' Smith and Detective Sergeant Roger 'The Dodger' Rogerson -- and the pot of gold and broken lives that friendship produced. Ian David, the writer of 'Police Crop', 'Joh's Jury' and other TV dramas, researched the story extensively. He met with Neddy Smith and conducted hundreds of interviews as well as consulting published works such as 'Darren Goodsir's Line of Fire' and Neddy Smith's own autobiography 'Neddy'. The result is a powerful and frightening story about police corruption and Sydney's underworld.

Image Processing and Acquisition using Python provides readers with a sound foundation in both image acquisition and image processing—one of the first books to integrate these topics together. By improving readers' knowledge of image acquisition techniques and corresponding image processing, the book will help them perform experiments more effectively and cost efficiently as well as analyze and measure more accurately. Long recognized as one of the easiest languages for non-programmers to learn, Python is used in a variety of practical examples. A refresher for more experienced readers, the first part of the book presents an introduction to Python, Python modules, reading and writing images using Python, and an introduction to images. The second part discusses the basics of image processing, including pre/post processing using filters, segmentation, morphological operations, and measurements. The last part describes image acquisition using various modalities, such as x-ray, CT, MRI, light microscopy, and electron microscopy. These modalities encompass most of the common image acquisition methods currently used by researchers in academia and industry.
