Modern Physics Chapters for Physics, Third Edition Addison-Wesley

Written for the full year or three term Calculus-based University Physics course for science and engineering majors, the publication of the first edition of Physics in 1960 launched the modern era of Physics textbooks. It was a new paradigm at the time and continues to be the dominant model for all texts. Physics is the most realistic option for schools looking to teach a more demanding course. The entirety of Volume 2 of the 5th edition has been edited to clarify conceptual development in light of recent findings of physics education research. End-of-chapter problem sets are thoroughly over-hauled, new problems are added, outdated references are deleted, and new short-answer conceptual questions are added.

The highly positive affirmation and wide reception that this book continues to receive from professors and students alike is the occasion for this 7th edition. Once again we have included a number of valuable suggestions for improvements, which we address as appropriate. In addition, we refer to a number of developments in atomic physics. Of these new developments in regard to exotic atoms, we mention antihydrogen in particular, because fundamental experiments in matter and antimatter can be expected in the future. Furthermore, we have inserted a chapter on the behaviour of atoms in strong electric fields. Experiments with corresponding lasers could only recently be realized. We thank our Jenaer colleague, R. Sauerbrey, for his contribution of this chapter. We have also included a new chapter on the behaviour of the hydrogen atom in strong magnetic fields. The results are of profound interest for two very different fields of physics: on the one hand, according to classical physics, one expects chaotic behaviour from Rydberg atoms in magnetic fields that can be created in the laboratory; thus, an association can be drawn to aspects of chaos theory and the problems of quantum chaos. On the other hand, the very strong fields necessary for low quantum numbers are realized in the cosmos, in particular with white dwarfs and neutron stars.

This problem book is ideal for high-school and college students in search of practice problems with detailed solutions. All of the standard introductory topics in mechanics are covered: kinematics, Newton's laws, energy, momentum, angular momentum, oscillations, gravity, and fictitious forces. The introduction to each chapter provides an overview of the relevant

concepts. Students can then warm up with a series of multiple-choice questions before diving into the free-response problems which constitute the bulk of the book. The first few problems in each chapter are derivations of key results/theorems that are useful when solving other problems. While the book is calculus-based, it can also easily be used in algebra-based courses. The problems that require calculus (only a sixth of the total number) are listed in an appendix, allowing students to steer clear of those if they wish. Additional details: (1) Features 150 multiple-choice questions and nearly 250 free-response problems, all with detailed solutions. (2) Includes 350 figures to help students visualize important concepts. (3) Builds on solutions by frequently including extensions/variants and additional remarks. (4) Begins with a chapter devoted to problem-solving strategies in physics. (5) A valuable supplement to the assigned textbook in any introductory mechanics course.

There has been increasing interest in including a significant treatment of modern physics in the introductory physics course. In response to this trend the authors have prepared an extended version of Physics, Part II. They have modified the last two chapters, Light and Quantum Physics, and the Wave Nature of Matter, and added five new ones, namely, The Structure of Atoms; Atomic Physics: Three Selected Topics; Electrical Conduction in Solids; Nuclear Physics - An Introduction; and Energy from the Nucleus.

Many good books have been written recently on this new field called biomimetics or bionics, but few exploring simultaneously the characterization and technological processes to produce man-made surfaces with similar properties as the biological ones. Bio-inspired surface structures offer significant commercial potential for the creation of antireflective, self-cleaning and drag reducing surfaces, as well as new types of adhesive systems. This review volume explores how the current knowledge of the biological structures occurring on the surface of moth eyes, leaves, sharkskin, and the feet of reptiles can be transferred to functional technological materials. It analyses how such surfaces can be described and characterized using microscopic techniques and thus reproduced. It also encompasses the important areas of current surface replication techniques and the associated acquisition of good master structures. The book is divided in three sections: an introduction of the skin functions and four functional properties of biological surfaces; physical, chemical and microscopy techniques for describing and characterizing the surfaces; and replication techniques for modifying non-natural surfaces. Sample Chapter(s). Chapter 1: Biomimetics of Skins (1,776 KB). Contents: Biomimetics of Skins (J F V Vincent); The Shark Skin Effect (A W Lang); Lotus Effect: Superhydrophobicity and Self-Cleaning (M Nosonovsky & E Bormashenko); The Moth-Eye Effect OCo From Fundamentals to Commercial Exploitation (A Gombert & B Blnsi); The Gecko Effect: Design Principles of the Gekkotan Adhesive System Across Scales of Organization (A P Russel & M K Johnson); Micro- and Nano-Scopic Observation of Biological Surfaces (Z-J Zhang & Q Ren); RIMAPS and Variogram Characterization of Micro-Nano Topography (N O Fuentes & E A Favret); Capillary Phenomena (G Callegari & A Calvo); Chemical Characterization of Biological and Technological Surfaces (P Kruse); Laser Interference Metallurgy (F Mcklich & A F Lasagni); Electrodeposition OCo Fundamental Aspects and Methods (S R Brankovic); Surface Modification by Plasma-Based Processes (E De Las Heras et al.). Readership: Academics and professionals in biomimeticism and materials science."
