This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation.

Consequences of diseases, e.g. impairments and activity limitations, are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation bridging the gap between clinical evidence and clinical decision-making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors, as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic, but concise review of the evidence (RCTs, systematic reviews and meta-analyses) that is relevant for clinical decision-making, and comments on assessment, therapy (training, technology, medication), and the use of technical aids as appropriate. Based on these summaries, clinical

algorithms / pathways are provided and the main clinical-decision situations are portrayed. The book is invaluable for all neurorehabilitation team members, clinicians, nurses, and therapists in neurology, physical medicine and rehabilitation, and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative, bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision-making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives. [Manual of Traumatic Brain Injury Management](#) Elsevier Health Sciences This manual gives step-by-step guidance on the evaluation and treatment of geriatric diseases and disorders. It covers incidence of disorders, diagnostic tests, associated diagnoses, clinical implications for mobility, and rehabilitation techniques. It offers a broad overview of the effects of aging on all body systems. Special

geriatric considerations for laboratory assessment, thermoregulations, and pharmacology are also discussed. This manual is a resource for all training clinicians in geriatric care and is a quick-reference guide for students and practitioners in this field. [Manual for WHO Disability Assessment Schedule WHODAS 2.0 Demos](#) Medical Publishing The third edition of [Manual of Traumatic Brain Injury](#) offers a thorough revision of the popular evidence-based guide to understanding and managing all levels of traumatic brain injury. Comprehensive in scope and concise in format, this reference describes the spectrum of injury from mild to severe and the continuum of care from initial injury to management of chronic sequelae. Chapters are designed with a practical clinical focus for targeted retrieval of content by topic area and for self-review. The text is organized into five sections. Part I addresses fundamental concepts necessary for understanding the underpinning of clinical decision-making. Part II is dedicated to mild TBI, including sport-related

concussion, with chapters covering topics from natural history to associated somatic disorders, post-concussion syndrome, and PTSD. Part III covers moderate to severe TBI and details prehospital emergency and ICU care, rehabilitation, treatment of related conditions, and postinjury outcomes. Part IV focuses on TBI-related complications, including posttraumatic seizures, spasticity, behavioral and sleep disturbances, and chronic traumatic encephalopathy (CTE). Part V reviews special considerations in selected populations such as pediatric TBI and TBI in the military, as well as medicolegal and ethical considerations in TBI, complementary and alternative medicine, and return to work considerations. Each chapter includes boxed Key Points which underscore major clinical takeaways, Study Questions to facilitate self-assessment and further emphasize core chapter content, and an Additional Reading list for a deeper dive into chapter concepts. Spinal Cord Diseases: New Insights for the Healthcare

Professional: 2011 Edition World Health Organization

The Second Edition of this single-authored volume integrates multiple disciplines of basic and clinical research to help clinicians further develop the best possible care for the rehabilitation of patients with neurologic diseases. From the readable descriptions of the structures and functions of pathways for movement and cognition, the reader comes to understand the potential for training induced,

pharmacologic, and near-future biologic interventions to enhance recovery. Dr. Dobkin shows how functional neuroimaging serves as a marker for whether physical, cognitive, and neuromodulating therapies work and how they sculpt the plasticity of the brain. Themes, such as how the manipulation of sensory experience can serve as a formidable tool for rehabilitation, run throughout the text, built from the level of the synapse to behaviors such as grasping, walking, and thinking. From illustrating how we may one day repair the brain and spinal cord to how to retrain spared and new pathways, Dr. Dobkin draws insights from a broad swath of fundamental research to give clinicians tools they can translate into bedside practices. The book treats the medical complications and therapeutic approaches to neurologic diseases as an interconnected matrix. The management of common medical issues, impairments, and disabilities are described across diseases. Special problems posed by patients with stroke, myelopathies, brain

injury, multiple sclerosis, degenerative diseases, and motor unit disorders receive individual comment. Short-term and delayed pulse interventions for patients, along with clinical trials, are dissected and put into perspective. The First Edition of this book was titled *Neurologic Rehabilitation*. The title has been changed to reflect Dr. Dobkin's sense that fundamental research now drives the field of neurologic rehabilitation even more than it could in 1996 when the First Edition was published. The Second Edition features entirely new chapters on functional neuroimaging of recovery; neurostimulators and neuroprostheses; integration into the book of many new clinical and neuroscientific observations relevant to the clinician; and extensive updating and expansion of all chapters. Readers, whether clinicians serving the rehabilitation team, or students or researchers in neuroscience, neurology, physical medicine, allied health, or bioengineering, will acquire new insights and tools for creative pursuits that aim to lessen the disabilities of

patients.
