Designing Multiscale Materials for Additive Manufacturing This report documents the development of a modeling platform for the multiscale concrete modeling of aging degradation with application to concrete structures in Nuclear Power Plants (NPP). The modeling methodology was developed to incorporate the synergistic effects of coupling multiple transport phenomena in concrete. Multiscale Concrete Modeling of Aging Degradation Particular focus of the multiscale modeling is placed on the selection of the RVE, specifically, the proper RVE size or the sufficient number of particles to be considered for a RVE packing.
