The relationship between popular music and consumer brands has never been so cosy. Product placement abounds in music videos, popular music provides the soundtrack to countless commercials, social media platforms offer musicians tools

for perpetual promotion, and corporate-sponsored competitions lure aspiring musicians to vie for exposure. Activities that once attracted charges of 'selling out' are now considered savvy, or even ordinary, strategies for artists to be heard and make a living. What forces have encouraged musicians to become willing partners of consumer brands? At what cost? And how do changes in popular music culture reflect broader trends of commercialization? *Selling Out* traces the evolution of 'selling out' debates in popular music culture and considers what might be lost when the boundary between culture and commerce is dismissed as a relic.

This book is devoted to the most used methodologies for performance evaluation: simulation using specialized software and

mathematical modeling. An important part is dedicated to the simulation, particularly in its theoretical framework and the precautions to be taken in the implementation of the experimental procedure. These principles are illustrated by concrete examples achieved through operational simulation languages (OMNeT ++, OPNET). Presented under the complementary approach, the mathematical method is essential for the simulation. Both methodologies based largely on the theory of probability and statistics in general and particularly Markov processes, a reminder

of the basic results is also available.
