MICAH DOUGLAS

Understanding the Mathematics of Personal Finance Springer Nature

Today's graduates should be grounded in the basics of personal finance and possess the skills and knowledge necessary to make informed decisions and take responsibility for their own financial well-being. Faced with an array of complex financial services and sophisticated products, many graduates lack the knowledge and skills to make rational, informed decisions on the use of their money and planning for future events, such as retirement. This book shows what you can do to improve financial literacy awareness and education. It covers the use of interactive games and tutorials, peer-to-peer mentoring, and financial literacy contests in addition to more formal education. It gives you a sample of approaches and experiences in the financial literacy arena. Divided into three parts, the book covers financial literacy education for grades K-12, college, and post-college.

The Macmillan Guide to Correspondence Study Greenwood

An assessment of Oregon personal finance teachers' beliefs and recommendations for secondary personal finance curriculum was the major purpose of this survey. A questionnaire based on the concepts and subconcepts in the Oregon Personal Finance Education Guide was used for data collection. All Oregon personal finance teachers who taught the personal finance requirement during 1975-1976 and 1976-1977 comprised the sample for this study. Four hundred questionnaires were sent and 182 questionnaires were returned, representing 45.5 percent of the population. The findings of this survey were based on these responses. Teachers responded from all school sizes and geographic areas of Oregon. The major disciplines represented were business education, home economics, mathematics, and social studies. Information received by the researcher was organized in three sections. In the first section, the best combination of the two semesters required for the personal finance course was identified. With a choice of grades nine through 12, any combination of semesters at grades 11 and 12 received the support of 72.8 percent of the teachers. In the second section, the five major concepts and 29 subconcepts of the Personal Finance Education Guide were discussed. More specifically, the researcher sought answers to the following questions: 1. What concepts and subconcepts are taught in the personal finance curriculum? 2. What concepts and subconcepts are needed in the personal finance curriculum? The five major concepts are: I. Employment and Income II. Money Management III. Credit IV. Purchase of Goods and Services V. Rights and Responsibilities in the Marketplace All major concepts were taught and perceived as needed by more than 85 percent of the personal finance teachers except Concept I, Employment and Income. Forty two percent of the respondents stated this concept was not taught, while 33 percent felt it was not needed. While these teachers saw a need for this information in the high school curriculum, they stated that it was or should be taught in the career education course. Comments concerning the concepts, the subconcepts, and the Guide as a whole were also included in this discussion. These remarks covered addition, deletions and organization of the material. The most requested addition was taxation, with 44 separate comments. Suggestions included federal, state, and local taxes; income, property, and inheritance taxes; appropriate methods of tax reporting; consequences of improper records; and uses of tax money at all levels. Fifty nine percent of the respondents requested a more definitive approach to Concept IV, Purchase of Goods and Services with specific units to include housing, transportation, and food. In section III of the survey the researcher hoped to find the most popular curriculum sequence for the two semester course. Only 62 percent of all respondents completed this section. Those teachers who did respond suggested Concept I, Employment and Income, and Concept II, Money Management, be taught in the first semester. Concept III, Credit, and Concept V, Rights and Responsibilities in the Marketplace, belonged in the second semester, with Concept IV, Purchase of Goods and Services, appropriate for

either semester. Those teachers who did not respond to this section gave two explanations: 1. If both semesters of the personal finance requirement were taught in the same year, the curriculum sequence was unimportant. 2. Schools using the "unit topic" approach were able to separate concepts and subconcepts by semesters, but "process oriented" programs, where concepts and subconcepts overlapped, made semester divisions irrelevant. The Oregon Personal Finance Education Guide is scheduled for revision during 1978. The suggestions and recommendations of the secondary personal finance teachers, as presented in this survey, will be used in this revision. *Guide to the Evaluation of Educational Experiences in the Armed Services* Greenwood Mathematics for Social Justice offers a collection of resources for mathematics faculty interested in incorporating questions of social justice into their classrooms. The book begins with a series of essays from instructors experienced in integrating social justice themes into their pedagogy; these essays contain political and pedagogical motivations as well as nuts-and-bolts teaching advice. The heart of the book is a collection of fourteen classroom-tested modules featuring ready-to-use activities and investigations for the college mathematics classroom. The mathematical tools and techniques used are relevant to a wide variety of courses including college algebra, math for the liberal arts, calculus, differential equations, discrete mathematics, geometry, financial mathematics, and combinatorics. The social justice themes include human trafficking, income inequality, environmental justice, gerrymandering, voting methods, and access to education. The volume editors are leaders of the national movement to include social justice material into mathematics teaching. Gizem Karaali is Associate Professor of Mathematics at Pomona College. She is one of the founding editors of *The Journal of Humanistic Mathematics*, and an associate editor for *The Mathematical Intelligencer* and *Numeracy*; she also serves on the editorial board of the MAA's *Carus Mathematical Monographs*. Lily Khadjavi is Associate Professor of Mathematics at Loyola Marymount University and is a past co-chair of the Infinite Possibilities Conference. She has served on the boards of Building Diversity in Science, the Barbara Jordan-Bayard Rustin Coalition, and the Harvard Gender and Sexuality Caucus.

Personal Financial Literacy McGraw-Hill Education

This book equips undergraduates with the mathematical skills required for degree courses in economics, finance, management, and business studies. The fundamental ideas are described in the simplest mathematical terms, highlighting threads of common mathematical theory in the various topics. Coverage helps readers become confident and competent in the use of mathematical tools and techniques that can be applied to a range of problems.

Financial Literacy Education Understanding the Mathematics of Personal Finance An Introduction to Financial Literacy

Given the rapid pace of development in economics and finance, a concise and up-to-date introduction to mathematical methods has become a prerequisite for all graduate students, even those not specializing in quantitative finance. This book offers an introductory text on mathematical methods for graduate students of economics and finance-and leading to the more advanced subject of quantum mathematics. The content is divided into five major sections: mathematical methods are covered in the first four sections, and can be taught in one semester. The book begins by focusing on the core subjects of linear algebra and calculus, before moving on to the more advanced topics of probability theory and stochastic calculus. Detailed derivations of the Black-Scholes and Merton equations are provided - in order to clarify the mathematical underpinnings of stochastic calculus. Each chapter of the first four sections includes a problem set, chiefly drawn from economics and finance. In turn, section five addresses quantum mathematics. The mathematical topics covered in the first four sections are sufficient for the study of quantum mathematics; Black-Scholes option theory and Merton's theory of corporate debt are among topics analyzed using quantum mathematics.

Mathematics for Business and Personal Finance teaches students mathematics, in the context of business and personal finance like budgeting and money management, banking and credit, and saving and investing. This program provides valuable information on how to use math in everyday business and personal finance situations to fully understand how to manage one's financial resources effectively for lifetime financial security. Includes: print student edition

1977 supplement MIT Press

This survey gives an indication of how best to address the teaching of economics and personal finance in our nation. It must be state-by-state, because that is where curriculum decisions are made. The federal government must encourage states to place economic and personal finance education not only into state standards, but into the core curriculum. This report looks at the national picture and sees where we are succeeding and where we need more attention. Tables and maps.

Elementary and Secondary Education Act of 1966, Hearings Before the Subcommittee on Education Jones & Bartlett Publishers

This book is ideally suited for an introductory undergraduate course on financial engineering. It explains the basic concepts of financial derivatives, including put and call options, as well as more complex derivatives such as barrier options and options on futures contracts. Both discrete and continuous models of market behavior are developed in this book. In particular, the analysis of option prices developed by Black and Scholes is explained in a self-contained way, using both the probabilistic Brownian Motion method and the analytical differential equations method. The book begins with binomial stock price models, moves on to multistage models, then to the Cox-Ross-Rubinstein option pricing process, and then to the Black-Scholes formula. Other topics presented include Zero Coupon Bonds, forward rates, the yield curve, and several bond price models. The book continues with foreign exchange models and the Keynes Interest Rate Parity Formula, and concludes with the study of country risk, a topic not inappropriate for the times. In addition to theoretical results, numerical models are presented in much detail. Each of the eleven chapters includes a variety of exercises.

Vol. 11 # 1 & 2 Springer Science & Business Media

Curriculum and Teaching Dialogue is the journal of the American Association of Teaching and Curriculum (AATC). An important historical event in the development of organizations dealing with the scholarly field of teaching and curriculum was the founding of the AATC on October 1, 1993. The members of the AATC believed that the time was long overdue to recognize teaching and curriculum as a basic field of scholarly study, to constitute a national learned society for the scholarly field of teaching and curriculum (teaching is the more inclusive concept; curriculum is an integral part of teaching-the "what to teach" aspect). Since it's founding AATC has produced scholarship in teaching and curriculum and serves the general public through its conferences, journals, and the interaction of its members. The purpose of the organization was originally defined in Article 1, Section 2 of the AATC Constitution: "To promote the scholarly study of teaching and curriculum; all analytical and interpretive approaches that are appropriate for the scholarly study of teaching and curriculum shall be encouraged." Curriculum and Teaching Dialogue seeks to fulfill that mission.

Guide to the evaluation of educational experience in the Armed Service 76 McGraw-Hill Higher Education

An introduction to the mathematical skills needed to understand finance and make better financial decisions Mathematical Finance enables readers to develop the mathematical skills needed to better understand and solve financial problems that arise in business, from small entrepreneurial operations to large corporations, and to also make better personal financial decisions. Despite the availability of automated tools to perform financial calculations, the author demonstrates that a basic grasp of the underlying mathematical formulas and tables is essential to truly understand finance. The book begins with an introduction to the most fundamental mathematical concepts, including numbers, exponents, and logarithms; mathematical progressions; and statistical measures. Next, the author explores the mathematics of the time value of money through a discussion of simple interest, bank discount, compound interest, and annuities. Subsequent chapters explore the mathematical aspects of various financial scenarios, including: Mortgage debt, leasing, and credit and loans Capital budgeting, depreciation, and depletion Break-even analysis and leverage Investing, with coverage of stocks, bonds, mutual funds, options, cost of capital, and ratio analysis Return and risk, along with a discussion of the Capital Asset Pricing Model (CAPM) Life annuities as well as life, property, and casualty insurance Throughout the book, numerous examples and exercises present realistic financial scenarios that aid readers in applying their newfound mathematical skills to devise solutions. The author does not promote the use of financial calculators and computers, but rather guides readers through problem solving using formulas and tables with little emphasis on derivations and proofs. Extensively class-tested to ensure an easy-to-follow presentation, Mathematical Finance is an excellent book for courses in business, economics, and

mathematics of finance at the upper-undergraduate and graduate levels. The book is also appropriate for consumers and entrepreneurs who need to build their mathematical skills in order to better understand financial problems and make better financial choices.

Kiplinger's Personal Finance CRC Press

Political science and sociology increasingly rely on mathematical modeling and sophisticated data analysis, and many graduate programs in these fields now require students to take a "math camp" or a semester-long or yearlong course to acquire the necessary skills. Available textbooks are written for mathematics or economics majors, and fail to convey to students of political science and sociology the reasons for learning often-abstract mathematical concepts. A Mathematics Course for Political and Social Research fills this gap, providing both a primer for math novices in the social sciences and a handy reference for seasoned researchers. The book begins with the fundamental building blocks of mathematics and basic algebra, then goes on to cover essential subjects such as calculus in one and more than one variable, including optimization, constrained optimization, and implicit functions; linear algebra, including Markov chains and eigenvectors; and probability. It describes the intermediate steps most other textbooks leave out, features numerous exercises throughout, and grounds all concepts by illustrating their use and importance in political science and sociology. Uniquely designed and ideal for students and researchers in political science and sociology Uses practical examples from political science and sociology Features "Why Do I Care?" sections that explain why concepts are useful Includes numerous exercises Complete online solutions manual (available only to professors, email david.siegel at duke.edu, subject line "Solution Set") Selected solutions available online to students

The Mathematics of Finance AuthorHouse

This is the story about 10 students (the STAT PACK) who are working their way through lessons in money mathematics. They are serious students who progress to the point where they can, among many other things, calculate mortgage payments, understand the dangers of making minimum payments on credit card bills, explain a financial retirement savings program, demonstrate how a Ponzi scheme works, and provide illustrations showing the advantages of starting to save early. Their leader in this educational adventure is Herkimer, a cartoon character who provides stimulating questions and activities to enhance the learning process. Herkimer is not the teacher, but he is always present when Pack members have discussions relating to money topics they are studying. He is a Hobbs-like character (for those familiar with the Calvin and Hobbs comic strip) who is visible only to the Pack. Herkimer is not unfamiliar to the students since they had worked with him while learning basic statistics in a previous book titled THE STATISTICAL ODYSSEY OF HERKIMER AND THE STAT PACK. A major reason for the financial crisis that began in 2008 was a lack of financial literacy in citizens of all ages. Author Sanderson M. Smith is a multiple award-winning mathematics teacher (including the California Presidential Award for Excellence in the Teaching of Mathematics and a California National Educator Award) who developed a FINANCIAL MATHEMATICS course at Cate School (Carpinteria, CA) many years ago. This entertaining and easy-to-read book includes lessons and activities that were developed for students in the extremely popular Cate course.

An Elementary Introduction to Mathematical Finance CRC Press

"The only comprehensive resource available ... a solid perspective on the full range of programs now being offered via distance education". -- Choice The Oryx Guide to Distance Learning is the only comprehensive directory to over 1,200 courses offered via media-assisted teaching by accredited U.S. institutions. Prospective students can access detailed descriptions of courses available through audiocassettes, audiographic conferencing, electronic mail, videocassettes, broadcast television via local cable stations, computer tutorials, and online interaction via modems.

Mathematical Finance Cambridge University Press

Applied Mathematics for Personal Finance provides a general introduction to the ways that mathematics can be applied to personal financial decision-making. This book is suitable for college students with no previous background in economics or finance; only familiarity with high school algebra is assumed. This book demonstrates how you can utilize math skills you already know in application areas that may be unfamiliar; it also introduces some new math skills that you can apply to familiar problems. The book emphasizes the development and application of the economic life-cycle model as the framework for evaluating all of your personal financial decisions. Economists, including six Nobel Laureates, have spent close to a century developing the concept of life-cycle consumption smoothing. "Smoothing" refers to the need to spread your economic resources over your lifetime, taking into account that your future is highly uncertain.

The most trustworthy source of information available today on savings and investments, taxes, money management, home ownership and many other personal finance topics.

Modeling and Hedging Princeton University Press

This textbook on the basics of option pricing is accessible to readers with limited mathematical training. It is for both professional traders and undergraduates studying the basics of finance. Assuming no prior knowledge of probability, Sheldon M. Ross offers clear, simple explanations of arbitrage, the Black-Scholes option pricing formula, and other topics such as utility functions, optimal portfolio selections, and the capital assets pricing model. Among the many new features of this third edition are new chapters on Brownian motion and geometric Brownian motion, stochastic order relations and stochastic dynamic programming, along with expanded sets of exercises and references for all the chapters.
