The Eskimo about Bering Strait Wentworth Press

Five hundred years ago, Martin Luther's Ninety-Five Theses caught Europe by storm and initiated the Reformation, which

fundamentally transformed both the church and society. Yet by Luther's own estimation, his translation of the Bible into German was his crowning achievement. The Bible played an absolutely vital role in the lives, theology, and practice of the Protestant Reformers. In addition, the proliferation and diffusion of vernacular Bibles—grounded in the original languages, enabled by advancements in printing, and lauded by the theological principles of sola Scriptura and the priesthood of all believers—contributed to an ever-widening circle of Bible readers and listeners among the people they served. This collection of essays from the 2016 Wheaton Theology Conference—the 25th anniversary of the conference—brings together the reflections of church historians and theologians on the nature of the Bible as "the people's book." With care and insight, they explore the

complex role of the Bible in the Reformation by considering matters of access, readership, and authority, as well as the Bible's place in the worship context, issues of theological interpretation, and the role of Scripture in creating both division and unity within Christianity. On the 500th anniversary of this significant event in the life of the church, these essays point not only to the crucial role of the Bible during the Reformation era but also its ongoing importance as "the people's book" today.

This volume represents the published proceedings of an international conference on the Neurobiology and Evolution of the Mechanosensory Lateral Line System held August 31 to September 4, 1987, at the Center for Interdisciplinary Research at the University of Bielefeld, West Germany. The goal of this conference was to bring together researchers from all over the world to share information about a major aquatic sensory system, the evolution and function of which have largely remained an enigma since the 18th century. The "lateral line" or "lateralis" system has been used as an umbrella term to describe what originally (without the aid of modern anatomical techniques) looked like a series of pits, grooves, and lines on the head and trunk of fishes and some amphibians. For at least the past 30 years, however, it has been recognized that the lateralis system comprises not one, but at least two functional classes of receptors: mechanoreceptors and electroreceptors. The relative ease with which the appropriate stimulus could be defined and measured for the electroreceptive class has resulted in an explosion of information on this submodality during the past 20 years. As a result, there is little ambiguity about the overall

function of the electrosensory system, now generally regarded as an independent system in its own right. A similarly clear definition for the function of the mechanosensory lateralis system has not been as forthcoming.

This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it. This work is in the public domain in the United States of America, and possibly other nations. Within the United States, you may freely copy and distribute this work, as no entity (individual or corporate) has a copyright on the body of the work. Scholars believe, and we concur, that this work is important enough to be preserved, reproduced, and made generally available to the public. To ensure a quality reading experience, this work has been proofread and republished using a format that seamlessly blends the original graphical elements with text in an easy-to-read typeface. We appreciate your support of the preservation process, and thank you for being an important part of keeping this knowledge alive and relevant.

Historia Eclesiástica Indiana Univ of California Press

The culmination of a ten-year study, *Bivalve Seashells of Western North America* treats all bivalve mollusks living from northern Baja California, Mexico to Arctic Alaska. A total of 472 species are described and illustrated with detailed photographs and drawings. All habitats in the region are included from the intertidal splash zone to the abyssal depths of the ocean basins. The book has over 4,800 complete bibliographic references to the

bivalves, including citations on the biology, physiology, ecology, and taxonomy of this commercially and biologically important group. Character tables and dichotomous keys assist the reader in identification. Also included in the 764 page book is an illustrated key to the superfamilies of the region, and a complete glossary.

Written in 1595, Fray Mendieta's work presents the history of the advent of Christianity in the Caribbean and Mexican regions as a consequence of the Spanish conquest. He illustrates the triumph and tragedy of the missionary effort and the difficulties in the conversion of the Indians, conflicts between spiritual ends and material interests. This edition of translated sections also presents some translated sections from Mendieta's letters, including a letter addressed to King Philip II of Spain.

Human development is a long and steady process that began with stone tool making. Because of this skill, humans were able to adapt to climate changes, discover new territories, and invent new technologies. "Pressure knapping" is the common term for one method of creating stone tools, where a larger device or blade specifically made for this purpose is used to press out the stone tool. Pressure knapping was invented in different locations and at different points in time, representing the adoption of the Neolithic way of life in the Old world. Recent research on pressure knapping has led for the first time to a global thesis on this technique. The contributors to this seminal work combine research findings on pressure knapping from different cultures

around the globe to develop a cohesive theory. This contribution to this volume represents a significant development to research on pressure knapping, as well as the field of lithic studies in general. This work will be an important reference for anyone studying the Paleolithic, Mesolithic, and Neolithic periods, lithic studies, technologies, and more generally, cultural transmission.

The People's Book InterVarsity Press

The volume about Avatamsaka Buddhism in East Asia is the result of a symposium organized in France in 2008. 15 contributions reflect the ways of manifestation and of expression of Huayan doctrines in several geographical regions and at different periods. Compared with previous valuable studies, the present volume intends to open broader perspectives, to give the opportunity to develop opened problematics, based on primary sources, textual and iconological. The Avatamsaka doctrines have developed particular ways of expression and paradigms on the Chinese soil, as a sinized Buddhism, they may be said to have achieved a philosophical revolution in the history of Mahayana: the Absolute is not the goal of the philosophical and soteriological inquiry, but its point of departure. The world is not only an illusion to be transcended but a manifestation of this very Absolute. The Avatamsaka can be seen as the backbone of influential currents, the Chan or Zen, the Tiantai or Tendai, the Ritualistic Buddhism, the Pure Land teachings, as well as the Song studies. The renewal of problematics on history of religion in the Far East region, as the so-called combined scheme simultaneously philosophical (exoteric) and ritualist (esoteric), gives a meaning to the approach of Avatamsaka current as common denominator linked

from China till the Qitan region to Korea and Japan.

The research attempts to bridge the existing gap between the naturalistic observations of sound communication in anurans and the anatomical and physiological findings in their auditory nervous system. The motivation for this research concerns the author's interest in the neural representation of complex meaningful sounds - stimuli for which the nervous system is presumably designed to process. Such a representation, although suggested by electrophysiological recordings of patterns of activity in various neural centers, requires a behavioral confirmation that these, in fact, are the principles by which information is processed within the intact animal. To this end, vocal behavior has been evoked from the males of laboratory colonies of bullfrogs (*Rana catesbeiana*) in response to a restricted class of natural and synthetic sounds. The evoked vocal responses, having the signal characteristics of the bullfrog's mating call, were highly selective. To playbacks of the mating calls of 34 different species of frogs and toads, only the mating calls of certain male bullfrogs would evoke calling from the laboratory animals. By employing a standardized experimental technique, quantitative measures of evoked calling have been obtained for a large number of synthesized bullfrog mating calls.

Descriptions of New Cretaceous and Tertiary Fossils from the Santa Cruz Mountains, California Wiley-Interscience

This volume presents the proceedings of the NATO Advanced Study Institute on "Advances in Vertebrate Neuroethology" held at the University of Kassel, Federal Republic of Germany in August 1981. During the last decade much progress has been made in understanding the neurophysiological bases of behavior in both vertebrates and invertebrates. The reason for this is that a number of new physiological, anatomical, and histochemical techniques have recently been developed for brain research which can now be combined with ethological methods for the analysis of animal behavior to form a new field of research known as "Neuroethology". The term Neuroethology was originally introduced by S.L. Brown and R.W. Hunsperger (1963) in connection with studies on the activation of agonistic behaviors by electrical brain stimulation in cats. Neuroethology was more closely defined by G. Hoyle (1970) in the context of a review on cellular mechanisms underlying behavior of invertebrates. Since the 6th annual meeting of the Society for Neuroscience held in Toronto in 1976, Neuroethology has become established as a session topic.

From the Introduction by Theodora Kroeber, Editor: The number

of documents having to do with Ishi is finite. For the reader who wishes to know something of the sources from which the story flows, there are reproduced here the principal out-of-print and most inaccessible primary materials on Ishi and the Yahi Indians. Of first importance are monographs on Ishi, his people, his languages, his medical history, whose authors are Professors Thomas T. Waterman, Alfred L. Kroeber, Edward Sapir, and Saxton T. Pope, M.D. Most of these monographs are here reprinted in full. Next in interest and importance are the books of reminiscences concerning the Yahi Indians written by white settlers in or adjacent to Yahi country in the years following closely upon the gold rush. These are usually in small editions, long out of print. Two, those written by Carson and R. A. Anderson, are reprinted in full; the others, only those parts having to do with Ishi and the Yahi. There are letters bearing on our subject, newspaper accounts, and pictures, of which we include significant examples. There are as well books and articles having to do only in part with Ishi and his people. We reprint only those parts. Beyond these essential primary materials, the editors made hard choices to keep the number of pages realistic. Readers with areas of special interest will regret some of our exclusions among the secondary but often fascinating accounts: of archaeological findings in the Yahi homelands of linguistic quirks and grammatical technicalities--a large literature, difficult for the uninitiate; of medical history when it adds nothing to our understanding of the man Ishi. Our order of presentation is chronological, beginning with the background materials, then going to Ishi's first entry into the outside world, then to his years at the museum, and, finally, to his death. We have not included

the occasional newspaper stories of still-living Yahi Indians supposed to have been seen or heard in the Yahi hills and caves after Ishi's departure, since none were ever substantiated. When in 1914 Ishi returned to his old home for a few weeks with Waterman, Kroeber, Pope, and Pope's son, Saxton, Jr., he found the land, the caves, and the village sites as he had left them.

This is a comprehensive catalogue of the living marine Bivalvia of China. Over 1,140 species are arranged in systematic order reflecting the phylogenetic relationships of the supraspecific taxa, together with almost 3,500 binomina which fall into synonymy. Bathymetric, substrate, and geographic distributional data are given.

The Emergence of Pressure Blade Making Univ of California Press
Electroreception Edited by Theodore Holmes Bullock and Walter Heiligenberg Presents recent findings in the research on modality of animal perception, particularly the ability to sense feeble electrical fields. Includes a new treatment of electric organs and their control, examination of receptors and their ionic mechanisms, and discussion of regeneration of the spinal cord. Uses electric fish as models. 1986 (0 471-81800-3) 722 pp.

Neurobiology of Taste and Smell Thomas E. Finger and Wayne L. Silver A survey of subdisciplines within the field of neurobiology and an overview of current issues, recent findings, and future research, and an excellent introduction to the specific study of the chemical senses, including olfactory, vomeronasal, and gustatory systems. 1987 (0 471-81799-6) 449 pp. Higher Brain

Functions Recent Explorations of the Brain's Emergent Properties Edited by Steven P. Wise Pushing at the frontiers of knowledge, the best minds in the field of neurophysiology develop original ideas first presented in a monograph by Evarts, Shinoda, and Wise, Neurophysiological Approaches to Higher Brain Functions. Organized into three sections, Motor Aspects of Higher Brain Function, Effects of Preparatory Set, and Cerebral Organization, this volume explores important and interesting research directed toward questions concerning higher brain functions that lie beyond the traditional concerns of sensor and motor physiology. 1987 (0 471-01111-8) 384 pp. Synaptic Function Edited by Gerald M. Edelman, W. Einar Gall, and W. Maxwell Cowan Examines synaptic function by focusing on five areas—biochemical and biophysical mechanisms of change in pre-and postsynaptic cells; the neurochemistry of transmitters and their release; the interactions of cells in small networks; synaptic plasticity related to long-term changes; and theoretical models of synaptic function. 1987 (0 471-85557-X) 944 pp.
